**Table 1: GLOSSARY OF ACRONYMS AND DEFINED TERMS**

<b><u>Acronym/Defined Term</u></b>	<b><u>Meaning</u></b>
BEV	Battery Electric Vehicle, sometimes followed with “-250” to indicate 250 miles of range
Capital	Capital Expense
CCS	Combined Charging System standard
CECP	Clean Energy and Climate Plan
CHAdemo	A direct current fast charging standard
Climate Act	Chapter 8 of the Acts of 2021
CO <sub>2</sub>	Carbon Dioxide
Customer premise work	Portion of make-ready infrastructure on the customer side of the meter
DCFC	Direct Current Fast Charging
EDC	Electric Distribution Company
EJC	Environmental Justice Community
EV	Electric Vehicle
EVI-Pro Lite	A tool for projecting consumer demand for electric vehicle charging infrastructure
EVSE	Electric Vehicle Supply Equipment
FCEV	Fuel-cell Electric Vehicle
FTE	Full-Time Equivalent
GHG	Greenhouse Gas
GVWR	Gross Vehicle Weight Rating
GWSA	Global Warming Solutions Act
ICE	Internal Combustion Engine
IT	Information Technology
kW	Kilowatt
kWh	Kilowatt hours
L1	Level 1

L2	Level 2
LDV	Light-duty Vehicle (vehicle classes 1-2, or those vehicles <10,000 pounds)
LI/EJC	Low Income Customers and Environmental Justice Communities
LI	Low-Income
MA	Massachusetts
MassEVIP	Massachusetts Electric Vehicle Incentive Program
MECO	Massachusetts Electric Company
MHDV	Medium- and Heavy-duty Vehicle (vehicle classes 3-6 and 7-8, or those vehicles above 10,000 pounds)
MOR-EV	Massachusetts Offers Rebates for Electric Vehicles program, including MOR-EV Trucks
MUD	Multi-Unit Dwelling, specifically properties with more than five units
MW	Megawatt
Nantucket Electric	Nantucket Electric Company
National Grid	National Grid USA
NREL	National Renewable Energy Laboratory
O&M	Operations and Maintenance
Phase I Program	First phase of the Company's Electric Vehicle Program (D.P.U. 17-13)
Phase II Program	Second phase of the Company's Electric Vehicle Program (D.P.U. 18-150)
Phase III Program	Third phase of the Company's Electric Vehicle Program (D.P.U. 21-91)
PHEV	Plug-in Hybrid Electric Vehicle, sometimes followed with "-20" or "-50" to indicate 20 or 50 miles of range, respectively
PIM	Performance Incentive Mechanism
PM <sub>2.5</sub>	Particulate Matter 2.5

Proprietary Network	Chargers using a proprietary hardware or a restricted access network available only to certain vehicle brands
PY	Program Year
QEL	Qualified Equipment List
RFP	Request for Proposals
SmartCharge Massachusetts	First phase of the Company's off-peak EV charging rebate offering
TCI-P	Transportation and Climate Initiative Program
TCO	Total Cost of Ownership
The Company	Massachusetts Electric Company and Nantucket Electric Company
Transportation Act	Section 29 of Chapter 383 of the Acts of 2020
Utility-side work	Portion of make-ready infrastructure on the utility side of the meter
V2G	Vehicle-to-Grid
V2H	Vehicle-to-Home
VGI	Vehicle Grid Integration
VIO	Vehicles in Operation
VMT	Vehicle Miles Traveled
ZEV	Zero Emission Vehicle
ZEV MOU	Zero Emission Vehicle Memorandum of Understanding

1 **I. Introduction**

2 **Q. Mr. Sondhi, please state your full name and business address.**

3 A. My name is Rishi Sondhi. My business address is 40 Sylvan Road, Waltham, MA 02451.

4 **Q. Please state your position.**

5 A. I am a Manager in the Clean Transportation Team at National Grid USA (“National Grid”).  
6 In this role, I provide services to National Grid’s various operating companies, including  
7 Massachusetts Electric Company (“MECO”) and Nantucket Electric Company  
8 (“Nantucket Electric”), each d/b/a National Grid (together, the “Company”).

9 **Q. Please describe your educational background and training.**

10 A. I have a Master of Business Administration (M.B.A.), degree from Babson College -  
11 Franklin W. Olin Graduate School of Business, Wellesley, MA (2008 - 2010). I have a  
12 Master’s Degree, Chemical Engineering (1997-1999) from the University of Cincinnati,  
13 Cincinnati, OH. In addition, I have a Bachelor’s Degree, Chemical Engineering (1993 -  
14 1997) from the Indian Institute of Technology (Banaras Hindu University), Varanasi, India.

15 **Q. Please describe your professional experience.**

16 A. I am a Manager in the Clean Transportation team. In this role, I help lead the development  
17 of programs and strategy for the residential customer segment. I also assist with developing  
18 regulatory proposals to address the transportation and climate goals of National Grid’s  
19 service jurisdictions. In my previous role as the Emerging Products Manager, I led the  
20 development of Company’s Phase II EV proposal and managed stakeholder engagement  
21 regarding transportation policies.

1 Prior to joining National Grid, I served as Product Manager, Energy Efficiency at  
2 Eversource Energy, where I developed new program offerings for business and residential  
3 customers. Prior to that, I served as Process Engineering Manager at Pall Corporation  
4 where, among other things, I guided clients in reducing energy consumption using  
5 advanced filtration technologies.

6 **Q. Have you ever testified before the Department of Public Utilities (“Department”)?**

7 A. Yes, I testified before the Department in D.P.U. 18-150 in support of the Company’s Phase  
8 II EV Program.

9 **Q. Ms. Gold, please state your full name and business address.**

10 A. My name is Julia Gold. My business address is 40 Sylvan Road, Waltham, MA 02451.

11 **Q. Please state your position.**

12 A. I am a Principal Policy and Strategy Analyst for the Clean Transportation team at National  
13 Grid USA. In this role, I provide strategic planning, policy, and regulatory support services  
14 to the Company.

15 **Q. Please describe your educational background and training.**

16 A. I have a Master’s Degree in Urban and Environmental Policy and Planning from Tufts  
17 University (2007-2009) and a Bachelor's Degree in American Civilization from Brown  
18 University (2002-2006).

1 **Q. Please describe your professional experience.**

2 A. I am the Principal Analyst for Policy and Strategy within the Clean Transportation team.  
3 In this role, I assist in the development of the Company's strategy for the Clean  
4 Transportation programs, support engagements related to transportation policy, both at the  
5 state and federal level, and lead stakeholder engagement. Additionally, I represent the  
6 Company on a variety of regional and national industry groups, alliances, and membership  
7 organizations. Prior to joining National Grid, I served as the Chief of Sustainability and  
8 Innovation at the RI Department of Transportation, the Climate Change Program Manager  
9 for the RI Department of Health, and the Director of the Green Center at Bristol  
10 Community College.

11 **Q. Have you ever testified before the Department?**

12 A. No, I have not.

13 **Q. Mr. Navarro, please state your full name and business address.**

14 A. My name is Jake Navarro. My business address is 40 Sylvan Road, Waltham, MA 02451.

15 **Q. Please state your position.**

16 A. I am the Director of the Clean Transportation Team at National Grid. In this role, I provide  
17 services to National Grid's various operating companies, including the Company.

1 **Q. Please describe your educational background and training.**

2 A. I have a Master of Business Administration (M.B.A.), degree from Boston University  
3 (2014 - 2017) and a Bachelor's Degree in Economics (2003-2007) from Middlebury  
4 College.

5 **Q. Please describe your professional experience.**

6 A. I am the Director of the Clean Transportation Team. In this role, I lead our end-to-end  
7 product management efforts focused on the electrification of transportation, including  
8 electric vehicle ("EV") strategy, new product development, and product performance and  
9 scaling. I have held several leadership positions at National Grid including Director of  
10 Commercial Portfolio Performance, Customer Excellence, and Communications

11 **Q. Have you ever testified before the Department?**

12 A. No, I have not.

13 **II. Purpose of Testimony**

14 **Q. What is the purpose of your joint testimony?**

15 A. The purpose of our joint testimony is to present the Company's proposal to implement a  
16 third phase of its Electric Vehicle Market Development Program in its service territory.  
17 We will describe the elements of this proposal and the benefits to customers and the  
18 Commonwealth. Further, our testimony will demonstrate that the proposal complies with  
19 the directives of D.P.U. 20-69-A and the Department's relevant standards of review. In  
20 addition to our joint testimony, the Company is sponsoring separate testimony of the

1 Demand Charge Alternative Panel, Exhibit NG-DCA-1, proposing a commercial electric  
2 vehicle rate design tariff pursuant to Section 29 of Chapter 383 of the Acts of 2020 (the  
3 “Transportation Act”), the Cost Recovery Panel, Exhibit NG-CRP-1, addressing cost  
4 recovery and Jared Goldfarb, Exhibit NG-JG addressing the recovery of certain customer-  
5 side make-ready offerings. Together, these program elements constitute the Company’s  
6 Electric Vehicle Phase III Program (“Phase III Program”).

7 **III. Program Summary**

8 **Q. Please summarize the Company’s Phase III Program proposal.**

9 A. The Phase III Program builds upon the Company’s first two Programs by providing  
10 offerings to meet the diverse needs of all the Company's customers, building the  
11 infrastructure required to support statewide EV adoption, and helping to enable the  
12 Commonwealth’s broader transition to a clean transportation future. Recognizing that this  
13 transition will require a complete shift in one of the economy’s largest segments and that  
14 each of the Company’s customers’ needs are different, this Program aims to provide  
15 options to meet the diverse needs of all the Company’s customers and provide shared  
16 benefits across all communities the Company serves. The Phase III Program is structured  
17 to both build the electric backbone for the transportation sector in our service territory and  
18 facilitate EV adoption, ensuring the Commonwealth’s homes, workplaces, fleets,  
19 communities, and highway-corridors are ready for EVs at the scale necessary to meet the  
20 Commonwealth’s zero-emission vehicle (“ZEV”) targets.

1 The Company’s proposed Phase III Program includes the following offerings for:

- 2 a. **Public and Workplace Segment:** provides financial support for Electric Vehicle  
3 Supply Equipment (“EVSE”) installations at public sites and workplaces, including  
4 pole-mounted Level 2 (“L2”) chargers, and a Direct Current Fast Charging  
5 (“DCFC”) commitment in environmental justice communities “EJCs<sup>1</sup>”;
- 6 b. **Residential Segment:** provides programmatic and financial support for EVSE and  
7 at-home charging enablement at:
- 8 i. properties with 1-4-units; and  
9 ii. multi-unit dwellings (“MUDs”) with five or more units;
- 10 c. **Fleet Segment:** provides financial support for EVSE installations, fleet  
11 electrification assessment services and tools, off-peak charging options, and  
12 support for electric school bus purchases;
- 13 d. **Other Offerings**
- 14 i. **Expansion of the Company’s Off-Peak Charging Rebate** (“Off-Peak  
15 Rebate Program”) approved in D.P.U. 18-150<sup>2</sup> for residential and fleet  
16 customers.
- 17 ii. **Workforce Development and Electrician Training** to support the EV  
18 workforce of the future, including new workforce entrants and incumbent  
19 workers.
- 20 iii. **Demand Charge Alternative Rate Structure** for commercial customers  
21 with a sliding scale of demand charges and volumetric charges, in  
22 accordance with the requirements of the Transportation Act.
- 23 iv. **Transformer Surcharge Waiver** to reflect the expense paid by the Phase  
24 III make-ready offerings and reduce G-1 customers’ bills.

---

<sup>1</sup> In Massachusetts a neighborhood is defined as an Environmental Justice population if any of the following are true: Block group whose annual median household income is equal to or less than 65 percent of the statewide median (\$62,072 in 2010); or 25% or more of the residents identify as a race other than white; or 25% or more of households have no one over the age of 14 who speaks English only or very well - English Isolation. <https://www.mass.gov/info-details/environmental-justice-populations-in-massachusetts>

<sup>2</sup> Massachusetts Electric Company and Nantucket Electric Company each d/b/a National Grid, D.P.U. 18-150, Order at 383-397 (2019).

1 The Company is proposing to run the Phase III Program for a period of four years. The  
 2 Company has estimated the total cost of the Phase III Program will be approximately  
 3 \$277.76M, with the budget apportioned across segments as shown in the following table.

4 **Table 2: Overview of Phase III Program**

<b>Public and Workplace Segment</b>	<b>Residential Segment</b>	<b>Fleet Segment</b>
<b>Targets:</b> ~7,500 L2 and DCFC ports	<b>Targets:</b> ~24,000 L2 ports for at-home charging	<b>Targets:</b> ~600 L2 and DCFC ports, ~175 fleet assessments, and ~300 EJC school bus rebates
<b>Cost:</b> \$96.77M	<b>Cost:</b> \$64.08M	<b>Cost:</b> \$98.23M
<p style="text-align: center;"><b>Other Supporting Offerings</b>            Off-Peak Rebate Expansion, Workforce Development and Electrician Training,            Company Staffing, IT, Program Evaluation  <b>Cost:</b> \$18.69M</p>		

5 The Company’s proposed Phase III Program will support the transition to a clean energy  
 6 future by reducing the barriers for residents, site hosts, and fleet owners to adopt clean  
 7 transportation choices while also providing the necessary support and resources for our  
 8 diverse customers to adopt EVs. The Phase III Program will support the installation of  
 9 cohesive networks of charging infrastructure, assist fleet operators to develop their own  
 10 electrification roadmaps, accelerate deployment of at-home charging, and increase  
 11 equitable access to the benefits of clean transportation. Not only do utilities play a key role  
 12 in deploying the infrastructure to support increased EV adoption, but they are critical

1 players to ensure the transition happens with a balance of equitable access and  
2 affordability, beneficial electrification, grid optimization, and the needs of the clean energy  
3 future.

4 **Q. What are the goals of the Phase III Program?**

5 A. The Company's goal is to create a future in our region where clean transportation is  
6 universal and the environmental and public health benefits are shared by all the Company's  
7 customers and communities. Although the transition to net-zero Greenhouse Gas ("GHG")  
8 emissions will happen over multiple decades, the investments necessary to support our  
9 customers in this transition must begin immediately and be aggressive. This proposal  
10 supports the Commonwealth in reaching its near-term and long-term transportation and  
11 climate goals through the acceleration of infrastructure deployment and EV adoption.

12 **Q. How are EJC's considered across the Phase III Program offerings?**

13 A. The Company has developed each segment of the proposal to more directly address the  
14 unique needs of EJC's and low-income customers. A guiding principle of the Phase III  
15 Program is to ensure that the proposed EV offerings are implemented equitably. EVs  
16 present a tremendous opportunity to mitigate the GHG emissions and particulate matter  
17 that exist disproportionately in EJC's. The installation of EV infrastructure and enabling  
18 EV miles driven within EJC's will provide increased access to clean transportation and  
19 promote public health. The Company recognizes that today, the upfront costs to EV  
20 adoption are high and that there is a need to tailor programs for EJC's and low-income  
21 customers, so they are not left behind in the transition to EVs.

1 The Company is laying the foundation for equitable access to clean transportation with  
 2 specially designated EJC and low-income offerings outlined by program segment in the  
 3 table below. Additional information is detailed in the individual program segment sections.

4 **Table 3: Overview of EJC and Low-Income Offerings**

<b>Public and Workplace Segment</b>	<b>Increased Incentives</b> <ul style="list-style-type: none"> <li>• 100% make-ready costs and up to \$4,000 rebate for EVSE (compared to \$2,000 for non-EJC) installed in EJC.</li> <li>• Network incentive (\$480 / port) for all ports installed in EJC.</li> </ul> <b>Unique Offerings</b> <ul style="list-style-type: none"> <li>• Commitment of 20 DCFC in 10 EJC.</li> <li>• Company-owned pole-mounted EVSE installed in at least 5 EJC.</li> </ul> <b>Expectations</b> <ul style="list-style-type: none"> <li>• 20% of ports deployed in EJC.</li> </ul>
<b>Residential Segment</b>	<b>Increased Incentives</b> <ul style="list-style-type: none"> <li>• Make-ready and EVSE support of up to \$1,700 for 1-unit properties (compared to \$700 for non-EJC) and up to \$2,700 for 2-4-unit properties (compared to \$1,400 for non-EJC).</li> <li>• 100% make-ready costs and \$4,000 rebate for EVSE (compared to \$2,000 for non-EJC) installed at MUDs in EJC.</li> </ul> <b>Unique Offerings</b> <ul style="list-style-type: none"> <li>• Increased financial support for LI/EJC<sup>3</sup> to cover costs of residential make-ready and managed-charging capable L2 EVSE.</li> <li>• EV Site Plans will help large MUDs (most of which are in EJC) develop a plan for EVSE.</li> </ul>

<sup>3</sup> LI/EJC customers are either on the low-income discount rate or live in Environmental Justice Communities.

	<p><b>Expectations</b></p> <ul style="list-style-type: none"> <li>Expect low-income customers to remain relatively small share of EV drivers through 2025. Targeting 10% of ports deployed for LI/EJC customers</li> <li>Expect relatively high share (&gt;40%) of MUD ports to be in EJCs.</li> </ul>
<b>Fleet Segment</b>	<p><b>Increased Incentives</b></p> <ul style="list-style-type: none"> <li>100% make-ready costs and \$4,000 rebate for EVSE (compared to \$2,000 for non-EJC) for fleets in EJCs.</li> </ul> <p><b>Unique Offerings</b></p> <ul style="list-style-type: none"> <li>300 EJC school bus incremental cost rebates (~\$175,000 / bus).</li> </ul> <p><b>Expectations</b></p> <ul style="list-style-type: none"> <li>40% of 150 private and non-profit Fleet Assessments conducted in EJCs.</li> <li>40% of fleet make-ready ports in EJCs.</li> </ul>

1

2 **Q. Are you sponsoring exhibits with your joint testimony?**

3 A. Yes. The table below lists the exhibits that we are sponsoring with our testimony:

<b>Exhibit</b>	<b>Description</b>
NG-EVPP-1	Testimony of Electric Vehicle Program Panel Rishi Sondhi, Julia Gold, and Jake Navarro
NG-EVPP-2	Summary of Estimated Phase III EV Program Costs
NG-EVPP-3	Summary of Estimated Costs by Cost Recovery Approach
NG-EVPP-4	Estimated Program Staffing Requirements
NG-EVPP-5	Estimated Public and Workplace Offerings Costs
NG-EVPP-6	Estimated Company-Owned Pole-Mounted EVSE Offering Costs
NG-EVPP-7	Estimated Residential 1-4-Unit Offerings Costs
NG-EVPP-8	Estimated Multi-Unit Dwelling Offerings Costs
NG-EVPP-9	Estimated Fleet Offerings Costs
NG-EVPP-10	Revision to Off-Peak Charging Rebate Program
NG-EVPP-11	Electric Vehicle Forecast
NG-EVPP-12	Company Stakeholder Outreach

1 **IV. Background**

2 **Q. Please provide an overview of the Commonwealth’s environmental policies related to**  
3 **the promotion of EVs.**

4 A. The Commonwealth of Massachusetts has positioned itself as a leader in the United States,  
5 proactively tackling the challenges posed by climate change by implementing ambitious  
6 programs and policies to equitably maximize the health and wellbeing of its residents and  
7 environmental benefits. As one of the first states in the nation to pass ambitious GHG  
8 targets in 2008, the Commonwealth has continued to lead with the passage of An Act  
9 Creating A Next-Generation Roadmap For Massachusetts Climate Policy, Chapter 8 of the  
10 Acts of 2021 (the “Climate Act”)<sup>4</sup> establishing a commitment to net-zero GHG emissions  
11 by 2050, with a minimum reduction of 50 percent by 2030 and a minimum reduction of 75  
12 percent by 2040. The Company not only supports the Commonwealth’s goals but has also  
13 committed to reach net-zero emissions by 2050. These collective goals will require swift  
14 innovation and action across all sectors of the economy.

15 With transportation being the largest contributing sector to GHG emissions in the  
16 Commonwealth (42% as of 2017)<sup>5</sup> and a significant source of pollutants that contribute to  
17 ground level ozone and other air pollution problems that adversely impact public health in  
18 the region, transportation electrification and EVs provide the opportunity to significantly

---

<sup>4</sup> St. 2021, c. 8, available at <https://malegislature.gov/Laws/SessionLaws/Acts/2021/Chapter8>.

<sup>5</sup> Transportation Sector Report: A Technical Report of the Massachusetts 2050 Decarbonization Roadmap Study December 2020; <https://www.mass.gov/doc/transportation-sector-technical-report>.

1 reduce emissions in the short- and long-term, while also supporting our grid to enable a  
2 clean energy future. Decarbonizing the transportation sector will be challenging, but the  
3 transition to a decarbonized and electric transportation future is vital and requires an  
4 immediate and aggressive set of responses to meet the Commonwealth’s Climate Act goal  
5 of net-zero emissions economy-wide by 2050.<sup>6</sup>

6 The Company and its peer electric distribution companies (“EDCs”) play an important role  
7 in accelerating this transition and will continue to be key enablers and partners to our  
8 customers, communities, and the industry as EV adoption grows exponentially in the  
9 coming years. Paired with support from complementary federal and state resources, such  
10 as the Massachusetts Offers Rebates for Electric Vehicles Program (“MOR-EV”)<sup>7</sup> and the  
11 forthcoming Transportation and Climate Initiative Program (“TCI-P”),<sup>8</sup> the Company’s  
12 comprehensive Phase III Program will ensure the Commonwealth, its communities,  
13 residents, and businesses have the infrastructure and support needed to facilitate  
14 widespread EV adoption.

---

<sup>6</sup> Climate Act, § 8.

<sup>7</sup> Massachusetts Offers Rebates for Electric Vehicles Program, <https://mor-ev.org/>.

<sup>8</sup> Transportation and Climate Initiative Program, <https://www.mass.gov/info-details/transportation-climate-initiative-tci>.

1 **Q. How many electric vehicles are in Massachusetts today?**

2 A. As of January 1, 2021, there were approximately 36,000 EVs registered in the  
3 Commonwealth, or about 0.6% of light-duty vehicles (“LDVs”) in operation in the state.<sup>9</sup>

4 In 2020, EVs were approximately 3.0% of new vehicle sales in Massachusetts;  
5 approximately 2.0% in the Company’s service territory and 4.0% in the rest of the state.<sup>10</sup>

6 This puts Massachusetts seventh in the nation in EV sales, but far from the leader  
7 (California is at nearly 8.0%).<sup>11</sup> Nationwide, the United States averaged 2.0% of new

8 vehicles sales in 2020, far from EV sales leaders Europe (10%) and China (5.7%).<sup>12</sup>

9 In 2020, approximately 70% of new EVs sold in the Commonwealth were battery electric  
10 vehicles (“BEVs”) and 30% were plug-in hybrid electric vehicles (“PHEVs”), along with  
11 a single fuel-cell electric vehicle (“FCEV”), highlighting the importance of public and at-  
12 home charging infrastructure for BEVs.<sup>13</sup>

13 As of January 1, 2021, there were 32 medium- and heavy-duty (“MHDVs”) electric  
14 vehicles out of approximately 204,000 MHDVs in the Commonwealth. All were BEVs and  
15 most are transit or school buses. However, there are currently more than 50 MHDV models

---

<sup>9</sup> IHS-Polk Vehicle in Operation data for Massachusetts as of January 1, 2021. Data purchased by the Company. See also <https://ihsmarkit.com/products/automotive-market-data-analysis.html> (“IHS Polk”)

<sup>10</sup> Company analysis of IHS-Polk data on sales by territory within the Commonwealth.

<sup>11</sup> Alliance for Automotive Innovation, 2020 Vehicles Sales by State, accessed May 5, 2021, at <https://www.autosinnovate.org/evagenda>.

<sup>12</sup> International Energy Agency (IEA), Global EV Outlook 2021, accessed July 12, 2021, at <https://www.iea.org/reports/global-ev-outlook-2021/trends-and-developments-in-electric-vehicle-markets>.

<sup>13</sup> Company analysis of IHS-Polk data.

1 available, and more than 125 models are expected to be available by 2023.<sup>14</sup> The total cost  
2 of ownership (“TCO”) for BEV MHDVs continue to decline as manufacturing scales, and  
3 adoption is expected to transition quickly as each segment reaches TCO parity. State  
4 government resources, such as the approximately \$10 million MOR-EV Trucks Program,  
5 will accelerate that vehicle transition.

6 **Q. What is the pace of EV adoption necessary to meet the Commonwealth’s**  
7 **decarbonization goals?**

8 A. As explained in the MA 2050 Decarbonization Roadmap Report:

9 The current pace of EV adoption in the Commonwealth lags the pace  
10 necessary to achieve decarbonization targets compliant with the Global  
11 Warming Solutions Act (GWSA). Without new policy intervention (by the  
12 Commonwealth, California, or the federal government), less than 500,000  
13 vehicles are projected to be electrified in 2030. In contrast, a pace consistent  
14 with meeting GWSA targets implies that over one million of the 5.5 million  
15 light-duty vehicles (LDVs) projected to be then-registered in the  
16 Commonwealth are electric in 2030.”<sup>15</sup>

17 In addition to the Commonwealth’s broad and ambitious climate goals, Massachusetts was  
18 among the first states to join California and others, setting its zero-emission vehicle  
19 memorandum of understanding (“ZEV MOU”) targets of 300,000 LDVs registered  
20 by 2025<sup>16</sup> and 30 percent and 100 percent of all new MHDV sales to be ZEV

<sup>15</sup> Transportation Sector Report: A Technical Report of the Massachusetts 2050 Decarbonization Roadmap Study December 2020, accessed July 12, 2021, at <https://www.mass.gov/doc/transportation-sector-technical-report>.

<sup>16</sup> New England States for Coordinated Air Use Management (NESCAUM), Multi-State ZEV Action Plan: 2018-2021, accessed July 12, 2021, at <https://www.nescaum.org/documents/2018-zev-action-plan.pdf>.

1 by 2030 and 2050 respectively.<sup>17</sup> With approximately 36,000 LDV and 32 MHDV EVs  
2 currently registered in the state, the investments and actions taken over the next few years  
3 will be critical to accelerate and support this transition successfully. Longer term, the  
4 state’s interim Clean Energy and Climate Plan (“CECP”) noted the need for approximately  
5 750,000 to 1,000,000 EVs by 2030.<sup>18</sup> Exhibit NG-EVPP-11 provides forecasts associated  
6 with the ZEV MOU for LDVs as well as a custom forecast for MHDV through the end  
7 of 2025.

8 **Q. What is the current state of public charging infrastructure in the Commonwealth?**

9 A. The Company considers “publicly accessible” charging infrastructure to generally refer to  
10 parking locations that any member of the public can access and use, although there may be  
11 costs to do so (i.e., parking or access fees, fees for use of the charger, etc.). Related, some  
12 public charging networks are proprietary, indicating they only serve a subset of EVs on the  
13 road due to hardware compatibility (e.g., Tesla’s plug standard) or network restrictions  
14 (e.g., Rivian is using the Combined Charging System standard (“CCS”) but intends to limit  
15 many of its sites to Rivian customers<sup>19</sup>). Proprietary or restricted access networks arise

---

<sup>17</sup> Northeast States for Coordinated Air Use Management, Multi-State Zero Emission Medium- and Heavy-Duty Vehicle Initiative – Memorandum of Understanding (2020), accessed July 12, 2021, at <https://www.nescaum.org/documents/multistate-truck-zev-governors-mou-20200714.pdf>.

<sup>18</sup> MA Interim Clean Energy and Climate Plan for 2030 (Strategy T2, p.21), <https://www.mass.gov/doc/interim-clean-energy-and-climate-plan-for-2030-december-30-2020/download>.

<sup>19</sup> <https://electrek.co/2021/03/18/rivian-reveals-map-planned-fast-charging-stations-wall-charger/>.

1 more for fast charging than L2 charging, where nearly all vehicles can use the J1772 plug  
2 standard and there are few restrictions by vehicle brand.

3 As of June 30, 2021, there were approximately 3,504 publicly accessible L2 ports and 360  
4 publicly accessible DCFC ports in Massachusetts. Of these publicly accessible ports, 1,369  
5 L2 and 107 DCFC are located in the Company's service territory, about 38% of the  
6 statewide total. Public charging access is growing, with over 50% growth in publicly  
7 accessible L2 ports installed in 2019, 2020, and already in 2021. Public DCFC growth is  
8 slower, adding 20 ports in the past 12 months. Public DCFC development is also somewhat  
9 nuanced due to different charging standards, proprietary networks, and business models  
10 (e.g., use of Volkswagen settlement funds via Electrify America).

11 However, these high-level port counts can obscure the local realities of EV charging access.  
12 Public ports in Company territory were located at approximately 640 sites, however there  
13 are only 15 sites with two or more DCFC ports.<sup>20</sup> Existing DCFC ports are also split across  
14 the CCS, CHAdeMO, and Tesla charging standards, further reducing the likelihood of  
15 drivers being near a compatible port. At a local level, a significant number of customers

---

<sup>20</sup> Alternative Fuels Data Center, U.S. Department of Energy, *available at* <https://www.afdc.energy.gov/stations/#/analyze?region=US-MA&country=US&fuel=ELEC>. (Data as of June 30, 2021) The Company filtered the data to derive the approximate number of public Level 2 and DCFC ports in Massachusetts. (Under "Advanced Filters", Filter "Location" as "United States" and "Massachusetts", filter "Fuel" by "Electric" and "Charger Types" using both "Level 2" and "DC Fast" separately, filter "Station" by "Public" and "Available").

1 live and drive in areas with minimal public EVSE today, sometimes referred to as  
2 “charging deserts.”

3 **Q. What is the current state of at-home charging?**

4 A. At-home charging access is critical to enabling and sustaining personal EV ownership.  
5 Among current EV owners, generally considered early adopters, approximately 95% had  
6 access to at-home charging in 2020, representing 80-85% of all EV charging energy.<sup>21</sup> The  
7 vast majority of BEV drivers today have L2 charging at home (95% of Tesla owners  
8 and 60% of non-Tesla BEV owners), whereas two-thirds of PHEV drivers use  
9 Level 1 (“L1”) chargers at home.<sup>22</sup> An estimated 5% of all residential customers are L2  
10 “EV ready” today (i.e., they have an existing 240-volt outlet near their car), although  
11 almost none of the 36% of customers living in duplex or multi-family properties have L2  
12 EV ready spots today.<sup>23</sup> The Company estimates over 50% of its residential customers face  
13 a significant barrier to at-home charging, although those barriers are addressable with  
14 utility planning and financial support, especially as vehicle and charger costs are expected  
15 to decline over time.

<sup>21</sup> 2020 Survey of Rhode Island EV owner from Rhode Island Electric Transportation Initiative Evaluation Final Report – Rate Year 2, page 17 ([http://www.ripuc.ri.gov/eventsactions/docket/4770-NGrid\\_RY2%20Transportation%20Initiative%20Annual%20Report%20Combined%20\(10.30.2020\).pdf](http://www.ripuc.ri.gov/eventsactions/docket/4770-NGrid_RY2%20Transportation%20Initiative%20Annual%20Report%20Combined%20(10.30.2020).pdf) (“RI RY2 Evaluation Report”) and Finding 9 from the Phase I Program Year 2 evaluation report, D.P.U. 21-67 Exhibit NG-MM-2 (“Phase I PY2 Evaluation Report”).

<sup>22</sup> RI RY2 Evaluation Report at 18.

<sup>23</sup> *Estimating EV charging infrastructure costs across major U.S. metropolitan areas*, International Council on Clean Transportation, Aug 2019, Table 6. <https://theicct.org/publications/charging-cost-US>

1 The importance of at-home charging access does not undercut the need for a robust network  
2 of public and workplace charging to ensure that customers without at-home charging  
3 access can own and operate EVs and to ensure that all customers can meet the entirety of  
4 their driving needs, including days away from home or with long-distance driving. The  
5 dynamic of drivers mostly relying on at-home charging, while still requiring robust public  
6 charging, is a major part of the difficult economics to operate profitable public EVSE,  
7 especially in the near-term with low numbers of EVs. Fleet operators are faced with similar  
8 needs. Fleets will primarily rely upon charging at a centralized depot but will also require  
9 the use of public charging infrastructure. The Company's proposed Phase III Program  
10 addresses public, workplace, at-home, and fleet charging infrastructure.

11 **Q. Is there outside funding available to support EV adoption and EV charger**  
12 **deployment?**

13 A. Yes. In addition to the existing utility programs in the Commonwealth, there are other state  
14 and federal programs and incentives that help to support EV adoption and the deployment  
15 of EV chargers. Although these programs have helped to move the market, there is much  
16 more needed to accelerate deployment of chargers and adoption of EVs. As learned during  
17 the Company's current EV offerings, the more alignment, compatibility, and cross  
18 leveraging of these resources, the better experience and process we can provide customers.

19 Specifically, in addition to the availability of federal tax incentives, the Commonwealth  
20 currently has six grant programs, funded by the Volkswagen Settlement and administered  
21 by the Massachusetts Department of Environmental Protection, that are aimed at

1 supporting electrification of the Commonwealth’s transportation network. These programs  
2 have been beneficial for customers and have allowed the Company to maximize the impact  
3 of its Phase I Program. However, as learned through the Company’s stakeholder outreach,  
4 it can be complicated, confusing, and burdensome for customers to navigate multiple  
5 funding programs offering similar or overlapping resources. Feedback from customers  
6 highlighted the desire for a more streamlined process. The Company aims to coordinate  
7 and leverage the funding for customers whenever feasible and recommends coordination  
8 with state entities to develop aligned and complementary offerings to ease the process for  
9 customers.

10 **Q. What are the barriers to EV adoption?**

11 A. The barriers to widespread EV adoption are multiple, although all are surmountable with  
12 sustained policies and investment. Key barriers to EV adoption currently include (but are  
13 not limited to):

- 14 • high costs (especially the upfront vehicle purchase and charger installation);
- 15 • lack of charging infrastructure; and
- 16 • range anxiety (the fear of being unable to complete a trip).

17 These primary barriers to EV adoption have been highlighted by the Company in its  
18 previous Evaluation Reports and multiple industry studies confirm they remain the same  
19 today<sup>24</sup>

---

<sup>24</sup> Barriers as summarized in Matteo Muratori et al 2021 Prog. Energy 3 022002 [doi.org/10.1088/2516-1083/abc0ad](https://doi.org/10.1088/2516-1083/abc0ad), and further supported by research from the Phase 1 PY 1 Evaluation Report (for example, Finding 7) and Phase I Program Year 2 Evaluation Report (for example Table 4-22).

1 EVSE have their own set of barriers, which can be broadly classified into those affecting  
2 installation and those affecting operation. EVSE financial viability at public, workplace,  
3 and MUD sites hinges on station utilization,<sup>25</sup> which is largely determined today by the  
4 number of nearby EV owners, trends in vehicle technologies (i.e., vehicle range and  
5 charging capabilities), and station pricing. EVSE tend to face difficult paths to financial  
6 sustainability without ongoing subsidies from the site hosts. Sites with “dedicated”  
7 vehicles, however, such as MUDs and fleet depots, will be able to integrate EVSE into  
8 their larger operations over time. Public DCFC are more likely to be financially self-  
9 sustaining in the long run,<sup>26</sup> however their near-term paths to profitability are still limited  
10 due to a small BEV population fragmented across multiple charging standards (CCS,  
11 CHAdeMO, and Tesla) and the financial impacts of demand charges at low levels of station  
12 utilization. Near-term charging economics, combined with the lack of existing public and  
13 private charging infrastructure, signal a strong need for utility support for charging  
14 infrastructure and customer programs to help accelerate EV adoption and meet the  
15 Commonwealth’s climate goals.

16 **Q. How does the Phase III Program address these barriers to EV adoption?**

17 A. Utility support for charging infrastructure and customer-facing charging programs can  
18 address many, but not all, of the top barriers to widespread EV adoption. The need for

---

<sup>25</sup> Muratori et al page 15, “PEV-charging economics vary with location and station configuration and depend critically on equipment and installation costs and retail electricity prices, which are dependent on utilization.”

<sup>26</sup> Muratori et al page 15, “it is likely that DCFCs will be profitable with sufficient demand.”

1 ubiquitous networks of public charging infrastructure, universal and low-cost at-home  
2 charging, and infrastructure planning and support for high-powered charging sites (such as  
3 fleet depots or highway rest stops) all require strong utility involvement. Financial support  
4 to address EVSE installation costs is paramount in each situation.<sup>27</sup> Additionally, the  
5 Company proposed an alternative to traditional demand-based structures to facilitate faster  
6 charging for electric LDVs, MHDVs, and fleet vehicles targeted to EVSEs at lower levels  
7 of utilization, which may reduce barriers to initial investment in new DCFC stations.

8 **Q. Did the Company size the Phase III Program with the Commonwealth's**  
9 **decarbonization goals in mind?**

10 A. Yes. The Company estimated future charging needs and segment sizes using a mix of  
11 approaches for the following segments: Public and Workplace; Residential, including those  
12 with 1-4-units, and MUDs (5 or more units); and Fleet. Overall, the segments are sized to  
13 meet the Commonwealth's ambitious EV adoption goals, focusing on the Company's  
14 service territory's share of the LDV ZEV MOU goal.

15 The size of the largest segment of the Phase III Program, Public and Workplace, is based  
16 upon the EVI-Pro Lite tool from National Renewable Energy Laboratory ("NREL") using  
17 an approach agreed upon by the Company, Eversource, and Until and reflecting the

---

<sup>27</sup> Phase I PY2 Evaluation Report Finding 2 states: "The Charging Program is very influential onsite hosts' decisions to install EV charging stations, and site hosts depend on incentives to install stations. Site hosts reported that they did not necessarily have a need to install stations but were heavily motivated by the amount of program funding available. Many of the customers interviewed in 2020 would not have pursued a station installation at the time they did without external funding covering most or all of the project cost."

1 statewide light-duty ZEV MOU target of 300,000 EVs in 2025. The outputs from EVI-Pro  
2 Lite were split across each utility's share of vehicles in the Commonwealth.<sup>28</sup> National  
3 Grid and Eversource sized their public and workplace programs to 80% of the remaining  
4 need of this output from EVI-Pro Lite to allow for deployments that might occur without  
5 the use of utility make-ready funds.

6 The Residential segment is sized based upon expected vehicle sales. The Residential 1-4-  
7 unit offerings are sized to serve roughly 15% of new EVs sold under the light-duty ZEV  
8 MOU forecast, reflective of market research on expected customer eligibility and  
9 participation. The MUD offerings are sized based on significant year-over-year growth in  
10 MUD ports enabled (relative to the Phase I Program). Based upon these growth  
11 assumptions, the MUD offerings are sized to address roughly two percent of long-term  
12 MUD charging needs.

13 The Fleet segment used a third-party market-driven forecast that incorporates MHDV  
14 availability. The Fleet segment is sized to enable both the light-duty ZEV MOU target  
15 in 2025 and the 30% of new sales of medium- and heavy-duty ZEV MOU in 2030 goals.  
16 Fleet operators are poised to quickly transition to electric fleets, as more EV models of all  
17 types become available in the coming years, corporate decarbonization goals continue to  
18 accelerate, and TCO approaches parity with ICE vehicles. The Fleet segment is sized to  
19 enable charging make-ready infrastructure for 25% of the new electric LDVs and 50% of

---

<sup>28</sup> Company analysis of IHS-Polk data of vehicles in operation data as of April 1, 2021.

1 the new electric MHDVs in the MECO territory. The Company plans to support this portion  
2 of the market based on prior programs and stakeholder feedback, acknowledging that fleet  
3 operators often make infrastructure decisions for reasons unrelated to EV charging  
4 programs, such as corporate goals, municipality clean transportation targets, or other  
5 economic or business expansion reasons for a specific fleet site.

6 **V. Phase III Program Proposal**

7 **A. Comparison of Phase I, Phase II and the Proposed Phase III Programs**

8 **Q. Please provide an overview of how the Phase III Program differs from the Phase I**  
9 **and Phase II Programs.**

10 A. The Phase I Program is an introductory program, the primary goal of which is to increase  
11 the availability of EV charging in the Company's service territory by facilitating the  
12 development of charging sites at public and commercial locations over a three-year  
13 period.<sup>29</sup> Similarly, the Phase II Program is an initial contribution to encourage residential  
14 off-peak EV charging, assist publicly funded fleet operators with vehicle electrification,  
15 and perform R&D to demonstrate the benefits of co-locating DCFC with a solar and storage  
16 site.<sup>30</sup> These programs have provided the Company with the experience and insights

---

<sup>29</sup> Petition of Massachusetts Electric Company and Nantucket Electric Company, each d/b/a National Grid, for Approval of its Electric Vehicle Market Development Program, and of its Electric Vehicle Market Development Program Provision, pursuant to G.L. c. 164, §§ 76, 94, and Acts of 2016, c. 448, D.P.U. 17-13, Revised Joint Pre-filed Direct Testimony of Karsten A. Barde and Brian J. Cronin Revised Exhibit KAB/BJC-1 at 5, (February 13, 2017).

<sup>30</sup> See D.P.U. 18-150, at 338-344.

1 necessary to deploy charging infrastructure and to integrate EV charging load with the  
2 Company’s electric system.

3 In contrast, the Phase III Program is an expansive and comprehensive program that  
4 addresses the diverse needs of different market segments as a means of advancing the  
5 Commonwealth’s near-term 2025 and 2030 decarbonization goals that will place the  
6 Commonwealth on a trajectory to achieve its net-zero emissions target by 2050. The Phase  
7 III Program builds on the Phase I and II Programs and therefore some of the program  
8 components are similar; however, the scale and breadth of the Phase III Program  
9 components is significantly larger given the Company’s experience and commitment to  
10 facilitate the Commonwealth’s achievement of its decarbonization goals. Please see the  
11 table below for a summary of the Program offerings.

**Table 4: Comparison of Phase I, Phase II and Phase III Programs**

<u>Segment offerings</u>	<u>Phase I</u>	<u>Phase II</u>	<u>Phase III</u>
<b>Public/Workplace Segment</b>			
L2 make-ready and EVSE rebates	Yes	Proposed (not approved)	Yes
DCFC make-ready and EVSE rebates	Yes (make-ready only)	Proposed (not approved)	Yes
DCFC commitment in EJs	No	No	Yes
Company-owned pole-mounted EVSE	No	No	Yes
Co-located energy storage incentives	No	R&D Approved	Yes

<b>Residential Segment</b>			
L2 residential make-ready and charger rebates	No	No	Yes
LI/EJC turnkey charging install	No	No	Yes
Off-peak charging rebates	No	Yes	Yes
MUD L2 make-ready and EVSE rebates	Yes	Proposed (not approved)	Yes
MUD EV Ready Site Plans	No	No	Yes
<b>Fleet Segment</b>			
Assessment Services	No	Yes	Yes
Make-ready and EVSE rebates	No	No	Yes
Off-peak charging rebates	No	No	Yes
Electric school bus rebates	No	No	Yes
<b>Other Offerings</b>			
Expansion of off-peak charging rebate	No	Yes	Yes
Workforce Development and Electrician Training	No	No	Yes
Demand Charge Alternative	No	No	Yes

- 1 **Q. How does the Phase III Program build on the Phase I and Phase II Programs?**
- 2 A. Over the course of the Phase I and Phase II Programs, the Company learned many lessons.
- 3 These lessons informed the design of the Phase III Program.
- 4 **Q. Please provide a summary of those lessons learned in Phase I and Phase II Programs.**
- 5 A. During the implementation of Phase I and Phase II, the Company learned the following:

- 1 1. The Phase I Program had a strong influence on site hosts' decisions to install EV  
2 charging stations. As highlighted in the Program Year 2 ("PY2") Evaluation  
3 Report, site hosts reported that they were heavily motivated by the program funding  
4 available. Several customers reported they would not have pursued a station  
5 installation at the time they did without external funding covering most or all of the  
6 project cost. As a result, the Company learned that a robust program with sufficient  
7 funding is needed to motivate the next tranche of site hosts to deploy charging  
8 stations.
- 9 2. L2 site hosts reported a variety of interests in offering EV charging, which include  
10 amenity to attract staff, visitors, and/or customers, or as a competitive advantage in  
11 attracting EV drivers to their business but they do not anticipate revenue from EV  
12 charging to be significant in the near term. As a result, the Company learned that,  
13 in the early stages of EV adoption, utilization may remain low which requires  
14 utilities to provide financial incentives to defray the cost of deploying charging  
15 infrastructure.
- 16 3. For DCFC installations, the high installation and EVSE costs have been and  
17 continue to be a barrier. Inclusion of (limited) funding for DCFC projects via  
18 Massachusetts Electric Vehicle Incentive Program ("MassEVIP") program  
19 increased the number of applications. As a result, the Company learned that  
20 including incentives for DCFC station equipment, which directly targets the high  
21 cost of DCFC stations is necessary.
- 22 4. The EV market is still nascent; more education and awareness are needed about the  
23 program to support site hosts in making the decisions necessary to enroll in the  
24 Company's programs. As result, the Company learned that including innovative  
25 marketing approaches and channels that are tailored to hard-to-reach customer  
26 segments is necessary. For example, the Company will target outreach for low-  
27 income customers and Environmental Justice Communities ("LI/EJC") and MUD  
28 properties.

29 **Q. Did the Company meet with stakeholders to gather feedback on Phase I and Phase II**  
30 **Programs?**

- 31 A. Yes. Over the past year, the Company conducted extensive outreach to more than 50  
32 entities, with stakeholders ranging from EJC representatives, municipalities,  
33 environmental groups/advocacy organizations, state agencies, and the EV industry. Over  
34 the course of the planning period, the Company met with many of the stakeholders multiple

1 times. These meetings were initially focused on providing updates and receiving feedback  
2 on the Phase I and II Programs. A list of the stakeholders engaged throughout this process  
3 is included in Exhibit NG-EVPP-12.

4 In addition to meeting with this broad group of stakeholders, the Company presented at  
5 various forums to help its site host recruitment, raise awareness efforts, and build  
6 partnerships and opportunities for collaboration. The Company attended and presented at  
7 quarterly meetings hosted by the Advanced Energy Group to provide regular updates on  
8 program status and recent activities, and to solicit and incorporate feedback from the  
9 public.

10 Finally, the Company maintained close coordination with Eversource through quarterly  
11 meetings to share lessons learned and discuss opportunities to collaborate jointly on the  
12 deployment of the EV programs.

13 **Q. Did the stakeholder engagement and feedback ultimately help inform the design of**  
14 **the Phase III Program proposal?**

15 A. Yes. The Company utilized the feedback received from stakeholders to inform the design  
16 of the Phase III Program. The Company received broad stakeholder support for the scope  
17 and scale of this Program, specifically the expanded nature of the programs to serve all  
18 customer segments and prioritize equity throughout. Key themes and feedback that were  
19 incorporated into this proposal include:

1           For Public and Workplace Segment:

- 2           • Simplify the segment design to educate and inform EV charging site hosts about  
3           available incentives and providing 100 percent coverage on the utility and  
4           customer-side make-ready work.
- 5           • Providing incentives for L2 EVSE will encourage site densification, encouraging  
6           more ports to be installed at each customer location.
- 7           • DCFC EVSE incentives are necessary to adequately support the installation of fast  
8           charging sites.
- 9           • Operation of low utilization, high power draw DCFC is a barrier to deployment  
10          without appropriate demand charge alternatives.
- 11          • Provide rebates to help support the ongoing charger networking costs.

12  
13          For Residential Segment:

- 14          • Home charging is a critical component of the EV charging eco-system, and  
15          solutions for integrating EV load should be implemented.
- 16          • Provide higher levels of financial support to LI/EJC customers to ensure residents  
17          are supported to be able to make their homes or apartments EV ready.
- 18          • Expand eligibility of equity-oriented offerings to include customers on the  
19          Company's low-income discount rate. For MUDs, buildings eligible for higher  
20          incentives are those in EJC's, have 50% or more of residents on a discount rate, or  
21          are designated public or low-income housing.
- 22          • For 1-4-unit properties, provide no-cost EV charging installs for LI/EJC customers.

23  
24          For Fleet Segment:

- 25          • Extend benefits of managed charging to fleet operators via managed charging  
26          rebates.
- 27          • Support for MHDV electrification to enable MOR-EV Trucks Program, through  
28          both infrastructure support and fleet assessments for public, non-profit and private  
29          fleets.
- 30          • Prioritize school bus and transit bus electrification, especially in LI/EJC's. In  
31          particular, stakeholders identified the harmful emissions from idling diesel school  
32          buses as a top priority to electrify.

1           **B.       Consistency with Department Standard of Review**

2           **Q.       Has the Department established a standard of review for EV charging proposals that**  
3           **is relevant to this proposal?**

4           A.       Yes. The Department opened an investigation regarding EVs and EV charging in 2013.<sup>31</sup>

5           At the conclusion of the first part of the investigation, the Department established the  
6           standard of review to be applied to any electric distribution company's proposal for cost  
7           recovery associated with ownership and operation of EVSE. Specifically, any such  
8           proposal must: (1) be in the public interest; (2) meet a need regarding the advancement of  
9           EV in the Commonwealth not likely to be met by the competitive EV charging market; and  
10          (3) not hinder the development of the competitive EV charging market.<sup>32</sup>

11          **Q.       In your opinion, does the Phase III Program meet the Department's standard of**  
12          **review?**

13          A.       Yes. The Phase III Program meets each of the Department's criterion. The Phase III  
14          Program supports the Commonwealth's public policy goals, meets a need for ramping up  
15          the EVSE in the state that has not been met by the competitive market and is not likely to  
16          be met by 2025 and supports, rather than hinders, the development of the competitive  
17          market by expanding the opportunities for market participants to gain experience in owning  
18          and operating EVSE. The Company's proposed Phase III Program received broad support  
19          from industry stakeholders, further indicating that the Phase III Program supports, rather

---

<sup>31</sup>       Order On Department Jurisdiction Over Electric Vehicles, The Role Of Distribution Companies In Electric Vehicle Charging And Other Matters, D.P.U. 13-182-A at 13 (August 4, 2014), affirmed in D.P.U. 17-05 Revenue Order and in D.P.U. 17-13 Final Order.

<sup>32</sup>       Id.

1 than hinders the competitive EV charging market. The Company has carefully designed  
2 and sized the Phase III Program offerings to address existing market barriers to EVSE and  
3 EV charging. The Phase III Program will promote and work with qualified EVSE vendors  
4 in the Commonwealth and help make Massachusetts residences EV ready for the future.  
5 The Company will address herein how each element of the Phase III Program is consistent  
6 with the Department's standard of review for utility EV proposals.

7 **Q. Did the Department provide directives in D.P.U. 20-69-A relevant to EV proposals?**

8 A. Yes, the Department's Order in D.P.U. 20-69-A provides that each company must file an  
9 EV proposal with: (1) a commercial EV rate design proposal addressing alternatives to  
10 demand charges; and (2) any new or expanded EV charging infrastructure proposals. The  
11 filing must be made on or before July 14, 2021.<sup>33</sup>

12 For EV infrastructure proposals, the Department directed the EDCs to coordinate future  
13 EV infrastructure program proposals to ensure a consistent approach for host recruitment  
14 and incentives – at a minimum and ensure the proposal is not duplicative of other build out  
15 incentive programs.<sup>34</sup> Additionally, new proposals should mitigate barriers that impede  
16 recruitment of DCFC site hosts for strategic locations.<sup>35</sup> Further, the Department directed  
17 the EDCs to incorporate analyses of traffic and EV charging patterns to identify priority

---

<sup>33</sup> Grid Modernization, D.P.U. 20-69-A at 40-41 (May 21, 2021).

<sup>34</sup> Id. at 46.

<sup>35</sup> Id. at 47.

1 locations for public stations and coordinate and propose statewide and company-specific  
2 performance metrics associated with EV charging infrastructure programs.<sup>36</sup>

3 For EV charging incentives, the Department directed the EDCs to avoid overlap by  
4 coordinating their EV charging incentive offerings. Additionally, the Department noted in  
5 any proposal, the EDCs should address issues related to customers charging their EV in  
6 multiple service territories.<sup>37</sup>

7 Lastly, for any proposed alternatives to traditional demand rate structure the Department  
8 directed the EDCs to consider the following: (1) converting kW-based charges to kilowatt-  
9 hour-based charges; (2) off-peak charging demand charge rebates or discounts; and (3)  
10 sliding scale demand charges based on the load factor of the electric vehicle charging site.<sup>38</sup>

11 Additionally, the Department provided that all proposed demand charge alternatives should  
12 be based on EV charging data collected through one of the following: (1) smart chargers  
13 or networked chargers; (2) EV telematics; (3) interval meters installed at request of  
14 customer.<sup>39</sup> The EDCs must coordinate development of demand charge alternative  
15 proposals for C&I EV customers, including public EV charging site hosts with L2 and/or  
16 DCFC stations.<sup>40</sup> The EDCs must identify a timeline and approach to transition all

<sup>40</sup> Id. at 43.

1 proposed demand charge alternatives to the future demand charge rate designs that will be  
2 enabled through the full deployment of advanced metering functionality.<sup>41</sup> Finally, any  
3 proposed tariff included as part of the EDC's demand charge alternative proposals must be  
4 filed as an exemplar tariff.<sup>42</sup>

5 **Q. In your opinion, does the Phase III Program satisfy the D.P.U. 20-69-A directives?**

6 A. Yes, the Phase III Program satisfies the Department's D.P.U. 20-69-A directives. The  
7 Company coordinated extensively with the Massachusetts EDCs on the development of its  
8 EV infrastructure program to ensure a consistent approach for host recruitment and  
9 incentives. In particular, the Company worked with Eversource and Unitil to make sure the  
10 EDCs' proposed programs are as consistent as possible. Based on the Company's and  
11 Eversource's respective experience to date with EV charging programs, the companies  
12 worked together to revise their program designs with the goal of offering all Massachusetts  
13 customers a consistent offering and EV charging experience. The Company also developed  
14 new offerings to address barriers to the recruitment of site hosts for the deployment of  
15 DCFC stations at strategic locations, as discussed further in Section VII. A. The Company  
16 will coordinate with EDCs to incorporate traffic analysis and intends to use traffic pattern  
17 and charging analyses in its system planning efforts in the future as discussed below. The  
18 Company also worked with the EDCs to develop and propose common statewide and  
19 company-specific performance metrics for the Program, as discussed below. Lastly, the

---

<sup>41</sup> Id.

<sup>42</sup> Id.

1 Company coordinated with the EDCs on the development of demand charge alternative  
2 offering. As part of this coordination, the EDCs discussed a timeline and approach to  
3 transition all proposed demand charge alternatives to the future demand charge rate designs  
4 that will be enabled through the full deployment of advanced metering functionality. The  
5 Company proposes a sliding scale of demand and volumetric charges for commercial  
6 customers, based on the load factor of the EV charging site, as discussed in the Demand  
7 Charge Alternative Panel testimony, Exhibit NG-DCA-1.

8 **Q. How closely aligned are the EDCs' electric vehicle proposals?**

9 A. The Company coordinated with Eversource and Unitil throughout the process of designing  
10 the Phase III Program. As a result of that coordination, the EDCs' proposals include  
11 consistent rebate levels, eligibility requirements and delivery methods for the Public and  
12 Workplace and Residential segments. Based on the companies' respective experience with  
13 earlier programs, however, there are slight differences, including that Eversource is not  
14 offering make-ready incentives for proprietary charging equipment, is not proposing a  
15 pole-mounted L2 charger offering and is not offering any L1 charger incentives for long-  
16 dwell time sites. Additionally, based on its experience in the Phase II Program, the  
17 Company is proposing a robust Fleet Segment offering, whereas Eversource's proposal  
18 includes a more limited Fleet pilot. The Company is also proposing an expansion of its  
19 Off-Peak Rebate offering from the Phase II Program, which Eversource has not included  
20 in its proposal. The Company also worked with Eversource and Unitil to jointly propose a  
21 Workforce Development and Electrician Training offering. However, as this is Unitil's

1 first EV charging incentive program, and due to Unitil's service territory size, Unitil's other  
2 EV program offerings differ to a greater extent.

3 **Q. Will the Company incorporate analyses of traffic and EV charging patterns to**  
4 **identify priority locations for future public charging stations?**

5 A. The Company has included in its proposed Phase III Program an effort to ensure public  
6 DCFC are installed in a number of strategically important locations within the program  
7 term, an effort that will involve assessing gaps in public charging. Beyond that initiative,  
8 however, the Company's Phase I and proposed Phase III Programs offer consistent  
9 financial support across the service territory, only differentiating support by market  
10 segment (e.g., public versus MUD charging) and whether the site is in an EJC. Thus, public  
11 station locations are otherwise largely determined by customers. The Company discusses  
12 below the proposed approach of assessing gaps in DCFC deployments near EJs and  
13 initiating installations. Further, the Company intends to use traffic pattern and charging  
14 analyses in its network planning efforts in the future.

15 **Q. Did the Company and EDCs coordinate to develop statewide performance metrics to**  
16 **report on the progress of their EV charging infrastructure programs?**

17 A. Yes, the Company consulted with Eversource and Unitil regarding performance metrics  
18 that each company would report for their service territory and programs. The Company  
19 proposes to track and report on the following statewide performance metrics for its Phase  
20 III Program:

- 21 • Program implementation metrics:
  - 22 ○ Total number of charging sites developed;

- 1           ○ Total number of ports installed by port type (i.e., L2 and DCFC) by market
- 2           segment (e.g., public, workplace, MUD, fleet, and EJC);
- 3           ○ Program financial support provided to DCFC stations;
- 4           ○ Program financial support provided to stations in EJs; and
- 5           ○ Total number of participants in the Workforce Development and Electrician
- 6           trainings.
- 7       • Program benefit metrics:
- 8           ○ EVSE utilization (e.g., kWh delivered per port per year); and
- 9           ○ CO<sub>2</sub> emissions avoided from EVs relative to ICE vehicles.

10 **Q. Did the Company coordinate with EDCs to develop company-specific performance**  
11 **metrics to report on the progress of its Phase III Program?**

12 A. Yes, the Company proposes to track and report on the following company-specific  
13 performance metrics for its Phase III Program:

- 14       • Program implementation metrics:
- 15           ○ Total number of pole-mounted EVSE installed;
- 16           ○ Total number of Residential Charger Rebates distributed;
- 17           ○ Total number of Residential Make-Ready Rebates distributed;
- 18           ○ Total number of Residential LI/EJC Offerings distributed;
- 19           ○ Total number of fleet assessments completed; and
- 20           ○ Total number of electric school buses enabled.

21 **Q. Is the Company proposing to recover incentives associated with these metrics?**

22 A. No. The statewide and company-specific performance metrics listed above are for purposes  
23 of reporting progress on the Company's Phase III Program over time. In addition to these  
24 reporting metrics, however, the Company is proposing two performance incentive  
25 mechanisms that will track the progress of other aspects of the Phase III Program and

1 provide an opportunity for the Company to earn incentives based on its progress. These  
2 performance incentive metrics are described in detail in Section IX, herein.

3 **VI. Program Details**

4 **A. Public and Workplace Segment**

5 **Q. Please describe the Public and Workplace Segment.**

6 A. Building off the success of the Phase I Program, the Public and Workplace Segment will  
7 provide similar make-ready infrastructure incentives and expand those offerings based on  
8 the lessons learned from the Phase I Program. The Company has found that additional  
9 financial incentives and offerings are needed to sufficiently spur EV adoption, make public  
10 and workplace charging more affordable for site hosts, and equitably serve its customers.

11 The Public and Workplace Segment will include the following offerings:

- 12 i. a Make-Ready offering with utility-side make ready incentives, customer-side  
13 make ready incentives, EVSE rebates, and a networking stipend for eligible  
14 ports;
- 15 ii. a DCFC commitment in EJCs;
- 16 iii. a pole-mounted EVSE offering;
- 17 iv. and an offering to provide incentives for technologies to expedite DCFC  
18 installations at constrained locations on the Company's system.

19 The Commonwealth's Decarbonization Roadmap's Transportation Technical Report<sup>43</sup>  
20 highlights the continued need for Public and Workplace charging to accelerate EV adoption  
21 at the pace necessary to reach the Commonwealth's goals.

---

<sup>43</sup> Massachusetts Executive Office of Energy and Environmental Affairs (EEA) 2050 Decarbonization Roadmap Study, Transportation Sector Technical Report, <https://www.mass.gov/doc/transportation-sector-technical-report/download>, Section 5.1.2.4.

1 **Q. What is the goal of the Public and Workplace Segment?**

2 A. The goal of the Public and Workplace Segment is to provide ubiquitous charging away  
3 from home within the Company’s service territory. The Public and Workplace Segment  
4 will provide incentives for make-ready infrastructure for L2 chargers, DCFC, and in special  
5 cases of long-dwell time parking, L1 chargers. The Company proposes to provide make-  
6 ready incentives to deploy approximately 2,500 Public L2 Ports, 4,700 Workplace L2  
7 Ports, 32 megawatts (“MW”) of Public DCFC ports, and a mix of 500 Public and  
8 Workplace L1 ports.

9 **Table 5: Public and Workplace Approximate Port and MW Targets**

Public L2	2,500 ports
Workplace L2	4,700 ports
Pole-Mounted L2	200 ports
Public DCFC	32 MW
Level 1	500 ports

10  
11 The Public and Workplace Segment aims to deploy approximately 20% of its ports within  
12 EJs. The Company is proposing to install a MW target of DCFC as the capacity of DCFC  
13 ports can range from 24-kW to 350-kW. It is important to note that a port target may not  
14 result in equal outcomes for meeting the Commonwealth’s DCFC needs, which serves as  
15 the motivation for adopting a capacity-based target.

1 **Q. How did the Company size the Public and Workplace Make-Ready offering?**

2 A. The Company used EVI-Pro Lite<sup>44</sup> to inform the sizing of the Make-Ready offering within  
3 the Public and Workplace segment. EVI-Pro Lite is an accepted and useful tool in helping  
4 to size EVSE infrastructure, however the outputs of the tool are highly sensitive to  
5 variability in the inputs. For example, a 1 percent shift in the input of percent of drivers  
6 with access to home charging changes the L2 and DCFC outputs by 2-3 percent. Similarly,  
7 a 1 percent shift between share of PHEVs and BEVs changes the number of L2 chargers  
8 by about 3 percent. Without being able to predict the exact ratio of BEVs to PHEVs on the  
9 road, as well as the exact future charging behaviors of those EVs, the Company emphasizes  
10 the importance of maintaining flexibility in the deployment of these port targets as well as  
11 their associated budgets.

12 When using EVI-Pro Lite, the Company started with the Commonwealth's light-duty ZEV  
13 MOU target for the end of 2025 which was scaled to the fraction of the Commonwealth's  
14 vehicles in operation ("VIO") that exist in the Company's service territory. The rest of the  
15 inputs to EVI-Pro Lite include: 50 percent PHEV support (approximately half of PHEV  
16 miles are electric), 77 percent of charging is done at home, 67 percent of vehicles being  
17 BEV-250, 5 percent of vehicles being PHEV-50, and 28 percent of vehicles being PHEV-  
18 20. As stated previously, the offering proposes to deploy EVSE to match the 80 percent of

---

<sup>44</sup> U.S. Department of Energy, Office of Energy Efficiency & Renewable Energy, Alternative Fuels Data Center, Electric Vehicle Infrastructure Projection Tool (EVI-Pro) Lite, <https://www.afdc.energy.gov/evi-pro-lite>

1 the remaining charging need to support the ZEV MOU target, and thereby align with  
2 Eversource. The Company believes this is a reasonable target accounting that some  
3 chargers may be installed without the assistance of the Company's make-ready incentives.  
4 Additionally, EVI-Pro Lite outputs a DCFC count of 150-kW chargers. As discussed  
5 earlier, not all DCFC provide the same charging capacity, and the Company proposes to  
6 target the overall DCFC capacity given by EVI-Pro Lite, which is by 150-kW DCFC port  
7 count.

8 ***Public and Workplace Make-Ready Offering***

9 **Q. Please describe the Public and Workplace Make-Ready offering.**

10 A. The Company proposes continuing a Public and Workplace Make-Ready offering to  
11 provide the charging infrastructure needed to support the Commonwealth's ZEV MOU  
12 target and other decarbonization goals including the 2030 CECP. The Public and  
13 Workplace Make-Ready offering will provide incentives for make-ready infrastructure for  
14 L2, DCFC, and, in select cases, L1 chargers. According to the PY2 Evaluation Report,  
15 customers (site hosts) found this program very influential in their decision to install  
16 charging stations.<sup>45</sup> The Company proposes to provide these incentives at similar incentive  
17 levels to what was provided in Phase I. The incentives below were determined based on  
18 the averages of the Phase I Make-Ready Program in addition to being benchmarked by  
19 peer utilities with similar program offerings.

---

<sup>45</sup> Phase I PY2 Evaluation Report, Section 4.1.1

1 The portion of the make-ready infrastructure on the utility side of the meter (“utility-side  
2 work”) will be completely paid for by the Company, so long as the new service is used  
3 exclusively for EV Charging. The Company will determine whether a new or upgraded  
4 service is necessary to serve EV loads for a site host.

5 The portion of the make-ready infrastructure on the customer’s side of the meter  
6 (“customer premise work”) will be covered up to 100-percent of the average installation  
7 cost for that installation type, not to exceed actual installation costs. To account for certain  
8 site-specific characteristics and potential cost-shifts in the industry, the Company may  
9 allow up to 150-percent of the average costs on a case-by-case basis. The average cost for  
10 the customer premise work for each installation type will be recalculated periodically to  
11 keep up with market dynamics.

12 **Q. Will the Company provide make ready incentives for proprietary networks?**

13 A. Yes. The Company will provide make-ready incentives for proprietary networks. Under  
14 this offering, proprietary networks are defined as those that either use proprietary hardware  
15 or restrict access to specific vehicle brands. The utility-side make-ready incentives will be  
16 the same level as non-proprietary networks. The customer side make-ready incentive for  
17 proprietary network EVSE will be 50 percent of the average installation costs for non-  
18 proprietary network EVSE incentive. In the event that a site hosts co-locates a proprietary  
19 network EVSE with non-proprietary network EVSE at a 4 to 1 ratio of proprietary network  
20 EVSE ports to non-proprietary network EVSE ports, those co-located proprietary network

1 EVSE ports will receive incentives equal to 65 percent of the non-proprietary network  
2 EVSE customer premise make-ready incentives.

3 The Company is proposing to provide incentives for proprietary networks to accelerate the  
4 deployment of these DCFCs within the Company's service territory. Across  
5 Massachusetts, there are 32 Tesla DCFC ports in the Company's service territory, and 186  
6 Tesla DCFC ports outside the Company's service territory. Given that the Company has  
7 half of the VIO, it is reasonable to conclude that the Company should support further  
8 deployment of these chargers even if the other utilities do not at this time.

9 **Q. Will the Company offer EVSE Rebates as a part of the Public and Workplace**  
10 **Segment?**

11 A. Yes. the Company is proposing to offer the following EVSE rebates for L2 and DCFC  
12 EVSE, which are broadly aligned with Eversource's and Unitol's proposed programs.  
13 Regarding DCFC, the Company experienced in its Phase I Program that DCFC deployment  
14 was challenging due to the high upfront costs for site hosts. However, when MassEVIP  
15 offered a limited DCFC EVSE rebate, the Company saw an increase in the number of  
16 DCFC project applications. Given the need for greater DCFC deployment, the Company  
17 is proposing to add DCFC EVSE rebates in the Phase III Program.

18 A summary of the proposed rebates levels is in the table below.

1

**Table 6: Public and Workplace EVSE Rebates**

<b>L2 EVSE Rebate Levels</b>	
<u>Customer Segment</u>	<u>Rebates Levels</u>
EJC	100% of installed costs for up to 10 ports
Muni	50% of installed costs for port 3-10
Other (Non-EJC / on-Muni Public and Workplace)	50% of installed costs for port 5-10
<b>DCFC EVSE Rebate Levels</b>	
<u>Customer Segment</u>	<u>Rebates Levels</u>
Public, Non-EJC	\$40,000/port; Ports must be above 50 kW, minimum 100 kW/site, site max EVSE incentive (\$400,000).
Public, EJC	\$40,000/port for ports above 50 kW and up to 150 kW, minimum 100 kW/site, site max EVSE incentive (\$400,000) For ports 150 kW and above, up to \$80,000/port.

2 **Q. Will the Company require networking for all public and workplace chargers?**

3 A. Yes. The Company will require networking for all workplace and public L2, and public  
 4 DCFC chargers. Networking allows customers to more effectively locate and efficiently  
 5 use chargers via mapping and queueing in charging apps. Additionally, networking  
 6 provides the Company with charging data which can be leveraged for future program  
 7 design and current program refinements.

8 **Q. Will the Company offer a networking allowance as part of the Public and Workplace  
 9 Make-Ready offering?**

10 A. Yes, for certain segments. The Company recognizes the challenge posed to site hosts by  
 11 networking fees. Therefore, the Company proposes to offer a stipend to support 4 years of  
 12 networking at a level of \$480/port for public L2 chargers and any EJC L2 chargers.

1 **Q. What are the eligibility requirements for the Public and Workplace Make-Ready**  
2 **offering?**

3 A. To be eligible for the Public and Workplace Make-Ready offering, the Company will  
4 continue to require EVSE installed at the site be on the Company's Qualified Equipment  
5 List ("QEL"). Additionally, the Company will continue to require that data is reported for  
6 5 years for public L2 chargers and DCFC, and for any workplace charging stations that  
7 include networking.

8 Site hosts will continue to be required to qualify as a non-residential customer and own or  
9 control the location where the EVSE will be deployed, including the associated parking  
10 spots for EV drivers.

11 **Q. How is the Company ensuring DCFC access in EJs?**

12 A. DCFC access within or in close proximity to EJs is a critical part of ensuring an equitable  
13 transition to clean transportation. All communities need accessible DCFC, but EJs have  
14 unique needs, often having higher percentages of MUDs (therefore more limited at-home  
15 charging), as well as often having a higher percentage of ride hailing drivers. To ensure  
16 these communities and customers have access to DCFC, the Company proposes a DCFC  
17 commitment in EJs offering to ensure the deployment of DCFC in up to ten underserved  
18 or high-need EJs. These communities will be identified at the start of the Phase III  
19 Program and the Company will work with its communities, stakeholders, EV charging  
20 developers, and the industry to support deployment in EJs. Before the mid-point of the  
21 Phase III Program, the Company will assess where gaps in DCFC deployment may still

1 exist. If no DCFC have been installed or are planned for installation within or in close  
2 proximity to the identified communities, the Company proposes to build, own, and operate  
3 up to (20) 150-kW DCFC ports across these targeted areas during the final two years of the  
4 Program. Prior to the Company building DCFC in EJC's, a six-month notice would be  
5 provided to station developers to highlight these EJC gaps and give them the opportunity  
6 to deploy DCFC prior to the Company doing so. The Company aims to collaborate with  
7 these EJC's and other stakeholders to identify sites for deployment, such as municipal  
8 public parking, commercial properties with willing site hosts, or other areas that are highly  
9 trafficked or easily accessible to the community being served.

10 ***Pole-Mounted EVSE Offering***

11 **Q. Please provide an overview of the Company's proposed pole-mounted EVSE offering.**

12 A. The Company is proposing to install, own and operate, pole-mounted EVSE, which are  
13 charging stations mounted on electric distribution poles, located near on-street parking  
14 locations. The Company proposes to work with up to 10 municipalities to deploy  
15 approximately 200 ports on Company-owned electric distribution poles over four years.  
16 After four years of the Program, the Company will offer to sell the pole-mounted EVSE to  
17 the municipality or the open market thereafter.

18 To ensure that the pole-mounted EVSE will reach underserved customers, the Company  
19 will target at least five EJC's. The Company will require the partnership of the municipality  
20 to identify suitable poles that will minimize the amount of make-ready infrastructure

1 needed and ensure the ports are sited in areas where customers with on-street parking are  
2 most likely to have access to the chargers. Eligibility criteria for the municipalities  
3 participating in the pilot include, but are not limited to, willingness to partner with the  
4 Company to deploy the chargers and compliance with agreements of other existing third-  
5 party attachments on poles or commit to being compliant with existing agreement by the  
6 end of the Company ownership period. The costs for the Company-owned pole-mounted  
7 EVSE offering are detailed in Exhibit NG-EVPP-6.

8 **Q. What are the benefits of pole-mounted EVSE?**

9 A. Pole-mounted EVSE will serve our customers that do not have access to private or  
10 designated parking. Customers without access to private or designated parking are more  
11 likely to live in a rented space in MUDs and customers who live in MUDs are also more  
12 likely to live in an EJC.<sup>46</sup> Therefore, deploying pole-mounted EVSE in EJCs can increase  
13 equitable access to EV charging. This solution will allow the Company to supplement the  
14 Public and Workplace segment offering to better address the EV charging needs in our  
15 service territory.

16 **Q. Has the Company conducted any pole-mounted demonstration projects?**

17 A. Yes. The Company is conducting a demonstration project of pole-mounted EVSE through  
18 a partnership with the City of Melrose. The demonstration uses Company-owned electric  
19 distribution poles, which carry the electric wires throughout the city, meaning that

---

<sup>46</sup> Company analysis of customer data and expected EJC areas.

1 electricity to power the charger is available directly on the pole.<sup>47</sup> The project in Melrose  
2 includes 15 chargers on nine poles. The chargers are designed to accommodate a single or  
3 dual charger on each pole. To date, eight chargers have been deployed and the remaining  
4 chargers are planned to be deployed by Fall 2021.

5 **Q. Are there any initial findings or lessons learned from the demonstration project in**  
6 **the City of Melrose?**

7 A. Yes. Initial results show an approximately 70% reduction in installation costs compared to  
8 ground-mounted chargers, supporting the Company's hypothesis that pole-mounted EVSE  
9 would reduce installation costs because the electric infrastructure to power the chargers is  
10 pre-existing on the distribution pole. Additional learnings from the partnership with  
11 Melrose also exposed the complex processes for third-party pole attachments. Third-party  
12 pole attachments require several highly specialized tasks for which the City of Melrose was  
13 not equipped with the necessary personnel and therefore the Company provided the  
14 necessary support to complete the process. In addition, the City of Melrose incurred several  
15 addition costs<sup>48</sup> to comply with the third-party attachments process. Asking future  
16 municipalities to follow the same third-party attachments process may be burdensome to  
17 the municipalities and hinder scaling up this product. Therefore, the Company is proposing  
18 to install, own and operate pole-mounted EVSE.

---

<sup>47</sup> In Massachusetts, the streetlighting infrastructure is only designed to support the voltage needed for lighting and is not able to support a charging station without costly rewiring. For this reason, installing pole-mounted chargers is simplest to install on utility electric distribution poles.

<sup>48</sup> Such as surety bonds and insurance requirements of the third-party attachments.

1 **Q. Why is the Company best positioned to install, own, and operate pole-mounted**  
2 **EVSE?**

3 A. The Company has many years of experience attaching products to our distribution poles  
4 and is not subject to the third-party attachments process. Therefore, the Company is in a  
5 unique position to own and operate EVSE mounted on Company-owned distribution poles.  
6 After a period of four years, the Company will offer to sell the EVSE to the municipality  
7 or to the open market, with the municipality having right of first refusal. The Company  
8 will work closely with the municipality to coordinate the transfer of the pole-mounted  
9 EVSE and expects the transition to be similar in scope to the ownership transfer of  
10 streetlights. Company ownership of pole-mounted EVSE will achieve three major benefits  
11 for customers. First, the Company will take on the risk of installing EVSE targeting areas  
12 with on-street parking that may not be financially feasible for the open market to install.  
13 Second, the Company will manage the pole attachments process, which eliminates costs of  
14 adhering to the third-party attachments process because the Company is not subject to the  
15 third-party attachment requirements for Company-owned attachments to poles. The  
16 Company will have the right to install the pole-mounted EVSE at its own discretion on  
17 jointly-owned poles because the equipment will be Company-owned. The Company will  
18 alert the joint-owner of the installation of the pole-mounted EVSE to ensure the all parties  
19 stay up to date on the equipment added to jointly-owned poles. Lastly, the Company's  
20 ownership of the pole-mounted EVSE will significantly decrease the timeline to  
21 deployment because the pole-mounted EVSE is no longer subject to the third-party

1 attachments process, ensuring that the EVSE is available to customers in the shortest  
2 timeline possible. As station utilization increases, the Company expects that the  
3 participating municipalities and/or open market will be financially motivated to purchase  
4 the EVSE from the Company.

5 **Q. How will the Company determine the price a customer pays to charge their vehicle at**  
6 **the Company-owned pole-mounted EVSE?**

7 A. The Company will work closely with the municipal partners to address the specific needs  
8 of the municipality. At a minimum, pricing will be set to recover costs of the electricity.  
9 Working closely with the municipality will also allow the Company to address parking  
10 policies, access controls, or priorities the city or town is looking to support.

#### 11 *Co-located Energy Storage Incentives*

12 **Q. Is the Company proposing incentives to support the use of energy storage technology**  
13 **to enable expedited installation of EV fast charging in locations with existing grid**  
14 **constraints?**

15 A. Yes, the Company is proposing to offer incentives to support DCFC and energy storage  
16 integrated technologies. This proposal will incentivize energy storage integrated with  
17 DCFC to reduce short to medium term barriers to the installation of high powered DCFCs  
18 in areas which provide considerable value to EV drivers due to their proximity to major  
19 thoroughfares but where current distribution system capacity may be insufficient to support  
20 DCFC sites without a system upgrade. Where the traditional wires solutions to alleviate  
21 these capacity constraints present both high system modification costs and multi-year  
22 implementation timeframes, the Company proposes offering additional incentives to

1 support rapid deployment of DCFC through the installation of commercially available  
2 DCFC and energy storage combination products. These products effectively reduce the  
3 capacity required from the grid while maintaining the customer delivered charging rate  
4 through the direct coupling of charging ports with dedicated energy storage.

5 In evaluating suitable locations for this small-scale program, the Company will consider  
6 the costs and implementation timeframes for infrastructure upgrades at a given location as  
7 a part of the Company's overall capital improvement plan to ensure that the incentive  
8 provides sufficient value versus a traditional wires solution. While the addition of such  
9 combination products at select locations is not expected to eliminate the need for  
10 infrastructure investment in a given area, it will play a key role in enabling the Company  
11 to accelerate the deployment of DCFCs in high value areas in the near term. The Company  
12 will budget \$2M for a maximum of five sites for this customer-owned solution, with the  
13 explicit purpose of enabling rapid DCFC deployment in high value areas where there are  
14 significant distribution capacity limitations.

15 **Q. What is the Company's proposed budget for the Public and Workplace Segment?**

16 A. The Company's proposed budget is in the table below summarized from Exhibit NG-  
17 EVPP-5.

18 **Table 7: Public and Workplace Segment Estimated Budget**

<b><u>Category</u></b>	<b><u>Budget</u></b>
<b>Utility Side Make Ready (Capital)</b>	<i>~\$18M</i>

<b>Customer Side Make-Ready (O&amp;M)</b>	~\$56M
<b>EVSE Rebates (O&amp;M)</b>	~\$19M
<b>Pole-mounted EVSE Operating Expense (O&amp;M)</b>	~\$0.2M
<b>Operating Expense for EJC DCFC Commitment (O&amp;M)</b>	~\$0.5M
<b>Networking Rebates (O&amp;M)</b>	~\$1M
<b>Marketing (O&amp;M)</b>	~\$2M
<b><i>Total</i></b>	<b>~\$97M</b>

1 **Q. How does the Public and Workplace Segment meet the Department’s standard of**  
2 **review for utility EV proposals?**

3 A. The Public and Workplace Segment is in the public interest as it sets incentives at a level  
4 that will foster an accelerated deployment of EVSE, while efficiently utilizing ratepayer  
5 funds. The Company has also coordinated with Eversource and Unitil to provide consistent  
6 approaches for incentives and site host recruitment and to ensure that the EDCs’ incentives  
7 are complimentary, not duplicative. The Department has recognized that the widespread  
8 adoption of EVs in the Commonwealth will improve air quality, reduce GHG emissions  
9 from the transportation sector, and require adding new technologies to the electric grid,  
10 including an increase of EV-related infrastructure.<sup>49</sup>

11 The Company’s Public and Workplace offerings will also meet the needs that have not and  
12 will not likely be met by the competitive EV charging market. The Department has also  
13 found that there is a need for increased charging station deployment in the Company’s

---

<sup>49</sup> D.P.U. 17-13, at 2, citing D.P.U. 13-182, at 3.

1 service territory to encourage EV adoption and that make-ready and other EVSE incentives  
2 address existing barriers to the development of charging stations at this time.<sup>50</sup>

3 The Company’s Public and Workplace offerings will help facilitate the development of the  
4 private EVSE market by supporting the costs to site hosts and allowing site hosts to choose  
5 from a range of technologies, ownership models and pricing approaches. Finally, the  
6 Company is not proposing to meet one-hundred-percent of the market need and will not  
7 “crowd out” EVSE deployments that might not be able to accept utility make-ready  
8 funding.

9 **B. Residential Segment**

10 **Q. Please provide a description of the offerings for the Residential Segment.**

11 A. Given the importance of at-home charging and the needed scale to support it, the Company  
12 is proposing Residential offerings to support all residential customers. The Residential  
13 offerings include:

- 14 1) for 1-4-unit properties:  
15 i) support for EVSE costs; and  
16 ii) residential make-ready, which encompasses:  
17 (a) 240V wiring near the customer’s parking space (e.g., in garage,  
18 driveway, or parking lot);  
19 (b) 240V outlet equipment and installation;  
20 (c) EVSE installation;  
21 (d) associated panel upgrades, service upgrades, and permits; and  
22 2) for MUDs:  
23 i) an expanded make-ready program; and  
24 ii) support for site-specific EVSE plans for 20+ unit properties.

---

<sup>50</sup> D.P.U. 17-13, at 16.

1 The financial and programmatic support is tailored to housing types (i.e., 1-unit, 2-4 unit,  
2 and 5-or-more unit residences) and equity-related criteria (e.g., customer lives in an EJC,  
3 customer is on a discounted rate). The goal of the offerings is to enable affordable,  
4 ubiquitous at-home charging for the Company's residential customers to accelerate EV  
5 (particularly BEV) ownership and enable the lower-cost, more convenient, and more grid-  
6 optimized charging that at-home EVSE provides. The Residential offerings will advance  
7 the adoption of EVs in the Commonwealth, which is in the public interest and is not likely  
8 to be done by the competitive market in time to meet the Commonwealth's climate goals.

9 Support for 1-4-unit properties will decrease the upfront costs associated with at-home  
10 charging by offering two types of rebates: one towards residential make-ready and one  
11 towards managed charging capable EVSE. The Residential Make-Ready Rebate will  
12 address the variable and significant costs associated with residential make-ready, including  
13 240V wiring in the garage or driveway of a property. The Company proposes to provide  
14 customers in 1-unit properties with a rebate up to \$700 and customers in 2-4-unit properties  
15 up to \$1,400, not to exceed actual costs. The Charger Rebate will support at-home charging  
16 by reducing the equipment costs of managed charging capable L2 EVSE. The Company  
17 proposes a one-time rebate per residential account of up to \$300 to offset the incremental  
18 cost difference between a networked and non-networked L2 EVSE. Finally, the LI/EJC  
19 offering will provide increased financial support to qualifying customers.

1 Support for MUDs will follow the design of the Public and Workplace Segment described  
2 earlier and build upon the lessons learned from the Phase I Program. In summary, MUDs  
3 will receive financial support to cover 100% utility-side costs, up to 100% of average  
4 customer-side make-ready costs per port, 100% of typical EVSE costs for sites in EJC  
5 and 50% of EVSE costs for all other MUDs, and Networking Stipends where requested.

6 **Table 8: Overview of Residential Segment Offerings**

<b>Offering</b>	<b>Description</b>
1-4-Unit Properties	
Residential Make-Ready Rebate	Reduces the costs associated with residential make-ready and EVSE installation in a customer’s driveway or garage. Up to \$700 for customers in 1-unit properties, and up to \$1,400 for customers in 2-4-unit properties, not to exceed actual costs. Enrollment in a managed charging program is required to take advantage of this rebate.
Charger Rebate	Reduces the cost of purchasing managed charging capable EVSE. Up to \$300 per customer towards the cost of a managed charging capable L2 EVSE, not to exceed actual costs. Enrollment in a managed charging program is required to take advantage of this rebate.
LI/EJC Offering	Increased financial support for qualifying customers. No-cost managed charging capable L2 EVSE and residential make-ready up to \$1,700 for customers in 1-unit properties and up to \$2,700 for customers in 2-4-unit properties, not to exceed actual costs.

5+ Unit Properties (MUDs)	
Support for utility-side infrastructure	100% of actual costs (with the right of the Company to deny program support to high-cost projects)
Support for customer-side infrastructure	Up to 100% (with the right of the Company to approve support up to 150% of the average cost per port on a case-by-case basis)
EVSE and EVSE installation support	Up to 100% of the average cost per port for sites in EJC's and 50% of the average cost per port for other sites, budgeted at \$4,000 per L2 port and \$2,000 per L2 port respectively, but not more than actual costs.
Networking Rebate	Upfront rebate of \$120 per port / year for 4 years (\$480 per port)
20+ Unit Properties	
EV Ready Site Plans	Up to \$6,000 to cover the cost of a site plan on the long-term infrastructure and equipment approach to installing at least one L2 port per residential unit. (Ideally done before any further make-ready or EVSE installations take place.)

- 1 **Q. How has the Company supported at-home charging in its prior programs?**
- 2 A. The Company has only supported at-home charging in a limited capacity to date. The
- 3 Company has successfully activated or committed 70 stations at MUDs as part of the Phase
- 4 I Program through 2020, with the Program Year 2 Evaluation Report finding “the Charging
- 5 Program continues to support MUD site hosts to provide opportunities for home charging.”
- 6 The report also recommended the Company “[c]ontinue to engage MUD site hosts to
- 7 promote station development and EV ownership. At-home charging is often less accessible
- 8 to people living in MUDs than in single-family residences. A robust MUD infrastructure

1 would support EV ownership for residents.”<sup>51</sup> The Company also offers an off-peak  
2 charging rebate program for residential EV drivers, providing discounts for off-peak  
3 charging (which is typically at home). The current off-peak charging rebate program,  
4 however, does not directly promote access to at-home charging.<sup>52</sup>

5 **Q. Why is at-home EV charging important for advancing EV adoption?**

6 A. At-home EV charging is critically important to enabling EV ownership, reducing the cost  
7 of EV ownership,<sup>53</sup> and creating opportunities to manage EV charging in grid-optimized  
8 and consumer-friendly ways.<sup>54</sup> At-home EV charging access has been rated as a primary  
9 criterion for those considering buying an EV.<sup>55</sup> Further, at-home charging can meet the  
10 charging needs of over 95% of travel days for long-distance BEVs, a sign of its tremendous  
11 importance in a BEV-oriented future.<sup>56</sup> Finally, research shows that EV owners with L2  
12 charging at home are half as likely to discontinue their EV ownership (i.e., go back to  
13 internal combustion engine (“ICE”) vehicles) as those with L1 charging at home,

<sup>51</sup> Phase I PY 2 Evaluation Report, at 2 and 31.

<sup>52</sup> D.P.U. 18-150 Order at 385.

<sup>53</sup> Borlaug et al., *Levelized Cost of Charging Electric Vehicles in the United States*, Joule (2020), <https://doi.org/10.1016/j.joule.2020.05.013> reports the lowest cost charging being at-home charging, with potential Lifetime Fuel Cost Savings (relative to internal combustion engine vehicles) of \$4,500 to \$9,400 for a BEV in Massachusetts. Fuel savings are maximized when at-home charging under time-of-use rates is maximized.

<sup>54</sup> Residential Electric Vehicle Rates That Work, SEPA, November 2019, page 10. <https://sepapower.org/resource/residential-electric-vehicle-time-varying-rates-that-work-attributes-that-increase-enrollment/>

<sup>55</sup> 2018 National Grid Customer Council EV Research, slides 8-9. Home charging was rated the top of eight items rated for purchase consideration of EVs, and home charging was rated the most important charging consideration among five options.

<sup>56</sup> Wei, W., Ramakrishnan, S., Needell, Z.A. et al. Personal vehicle electrification and charging solutions for high-energy days. *Nat Energy* 6, 105–114 (2021). <https://doi.org/10.1038/s41560-020-00752-y>, Figure 7, page 110.

1 highlighting the importance of L2 at-home charging to the EV ownership experience.<sup>57</sup>

2 Approximately 95% of EV owners in 2020 had access to at-home charging,<sup>58</sup> resulting in  
3 80-85% of charging happening at home.<sup>59</sup> The vast majority of BEV drivers today have L2  
4 charging at home (95% of Tesla owners and 60% of non-Tesla BEV owners), whereas two-  
5 thirds of PHEV drivers use L1 charging at home.<sup>60</sup>

6 **Q. Are there barriers to residential at-home charging?**

7 A. Yes, there are still many barriers for customers to charge at-home, especially those who do  
8 not live in single-family residences. These barriers include:

- 9
- 10 • having limited existing electric service or panel capacity to add EV charging;
  - 11 • parking spots with no or limited existing electrical access;
  - 12 • renting (e.g., landlords lacking incentives to invest their funds on EVSE, given the low  
13 share of EVs on the road today; tenants not wanting to invest their own funds on  
14 equipment and infrastructure for a property they do not own);<sup>61</sup>
  - 15 • having only on-street parking;
  - 16 • determining fair EVSE management, access, and payment/pricing approaches for  
17 EVSEs serving renters, multi-unit dwellings, or other shared parking, compounded by  
18 a lack of familiarity with these concepts among decision makers (e.g., condo boards);  
and

---

<sup>57</sup> “For access to level-2 charging from home compared to level-1, there are 52.8% lower odds of discontinuing [EV] ownership. ... This shows the importance of having higher speed level-2 charging at home over low speed level-1 charging.” From Hardman, S., Tal, G. Understanding discontinuance among California’s electric vehicle owners. Nature Energy (2021). <https://doi.org/10.1038/s41560-021-00814-9>

<sup>58</sup> RI RY2 EV 2020 Survey of Rhode Island EV owner

<sup>59</sup> 80% figure from Department of Energy at <https://www.energy.gov/eere/electricvehicles/charging-home>. 85% figure is the share of charging at home for those with home-charging, 2020 Bloomberg New Energy Finance EV Outlook, page 185.

<sup>60</sup> RI RY2 Evaluation Report, Figure 4-2.

<sup>61</sup> “Homeowners are six times more likely than renters to own an electric vehicle.” from Lucas W. Davis (2019) Evidence of a homeowner-renter gap for electric vehicles, Applied Economics Letters, 26:11, 927-932, <https://doi.org/10.1080/13504851.2018.1523611>

- 1           • other circumstances resulting in high installation or operating costs or lack of interest  
2           among the decision-makers to enable at-home charging.

3           The Company estimates that *more than half* of the Company’s residential customers face  
4           one or more of these barriers, particularly among the 9% who rent single-family homes,  
5           the 20% living in 2-4 unit dwellings, and the 17% living in 5+ unit dwellings.<sup>62</sup> Further,  
6           residential EVSE purchase and installation costs can be high and variable,<sup>63</sup> adding to the  
7           upfront cost barrier EVs still face relative to ICE vehicles.<sup>64</sup> As 62% of the Company’s  
8           customers living in two-or-more-unit dwellings live in EJCs, these cost and access issues  
9           are significant. And while there is a growing amount of free or low-cost charging available  
10          at public and workplace locations, in the long run customers without home charging are  
11          likely to face far greater fueling costs for their EVs as they pay the more expensive retail  
12          charging rates.<sup>65, 66</sup>

13          Of particular importance to multi-unit dwellings is the need to plan for future EVSE and  
14          charging loads to help reduce cost and simplify EVSE installations. Many residential sites,  
15          in the long run, will need to provide one L2 port per residential unit (a ratio that some new

<sup>64</sup> The 2020 Bloomberg New Energy Finance EV Outlook, Figure 295 shows a purchase price gap for BEVs, relative to ICE vehicles, in 2020 of nearly \$4,000.

<sup>65</sup> Borlaug et al.

<sup>66</sup> “The United States Needs More Fast Chargers: China Can Show How,” Rocky Mountain Institute Blog (January 29, 2021), <https://rmi.org/the-united-states-needs-more-fast-chargers-china-can-show-how/>.

1 construction building codes are adopting<sup>67</sup>). For example, a 30-unit building will need at  
2 least 30 L2 ports in the long run but will likely only use a few of them in the next couple  
3 years. Given these long-term needs, it is imperative to plan for charging infrastructure  
4 growth over time, as well as anticipate any cost efficiencies from consolidating the make-  
5 ready and construction work. Without proper planning, MUDs may start down an  
6 “incremental” path that does not scale well, only adding a few chargers at a time—resulting  
7 in higher construction and infrastructure costs—and possibly struggling to match the few  
8 EVSE locations with those of EV owner’s parking spots. The utility can play a unique and  
9 critical role in supporting site planning for long-term EVSE needs, helping sites anticipate  
10 EV-related load growth and find cost-reduction strategies. Without utility support, such  
11 forward-looking approaches are unlikely to occur.

### *One to Four Unit Offerings*

13 **Q. Please describe the financial and programmatic support the Company is proposing**  
14 **to offer customers in 1-4-unit properties.**

15 A. The Company is proposing to offer two types of rebates to encourage residential charging:  
16 1) a Residential Make-Ready Rebate towards the cost of necessary electrical upgrades  
17 required to install at-home EVSE; and 2) a Charger Rebate for the purchase of a managed  
18 charging capable L2 EVSE. These offerings enable at-home charging and solve unique  
19 challenges for residents in 1-unit properties, 2-4-unit properties, and LI/EJC customers.

---

<sup>67</sup> British Columbia has examples of such codes at <https://pluginbc.ca/policy/>. E.g., The City of Nelson requires “One stall per dwelling unit is required to be EV ready in new single family and multi-unit residential.” Massachusetts currently only requires one EV Ready space for certain new construction with 15 or more parking spaces.

1 LI/EJC customers are defined as: 1) customers who are on the Company’s low-income  
2 discount rate or 2) customers who reside in a property that meets at least one of the  
3 Commonwealth’s EJC criteria. If a customer meets the LI/EJC definition and lives in a 1-  
4 unit property, they qualify for the LI/EJC offering only if they own or lease a new or used  
5 EV with a purchase price of less than \$50,000, a purchase price requirement reflective of  
6 the Commonwealth’s MOR-EV rebate.<sup>68</sup>

7 **Q. Please describe the Residential Make-Ready Rebate offering.**

8 A. The Company is proposing a Residential Make-Ready Rebate to enable at-home L2 EV  
9 charging by reducing the customer’s cost for residential make-ready infrastructure. The  
10 Residential Make-Ready Rebate would enable at-home charging for the property’s current  
11 inhabitant(s) and would “future proof” the Company’s territory for at-home EV charging  
12 by providing L2 EV charging capability to the property’s future inhabitants. The  
13 Residential Make-Ready Rebate provides a one-time rebate per residential account to offset  
14 the high and variable costs to enabling L2 charging at home. The Company proposes to  
15 provide customers in 1-unit properties with a rebate up to \$700 and customers in 2-4-unit  
16 properties up to \$1,400, not to exceed actual costs.<sup>69</sup> Customers receiving this rebate would

---

<sup>68</sup> The State’s MOR-EV rebate requires the purchase price of a new vehicle to be less than \$50,000. <https://mor-ev.org/eligible-vehicles>. (Accessed June 29, 2021).

<sup>69</sup> The rebate amounts are informed by International Council on Clean Transportation’s findings that the average cost to install an L2 charger is \$680 in a detached house and \$2,000 in an attached house. Hardware and installation costs are included, and installation is composed of labor, materials, taxes, utility upgrades, and permits. Average costs do not include the L2 EVSE. *Estimating EV charging infrastructure costs across major U.S. metropolitan areas*, International Council on Clean Transportation, August 2019, at 6. <https://theicct.org/publications/charging-cost-US>

1 be required to enroll in one of the Company's managed charging programs: the Off-Peak  
2 Rebate Program, which incentivizes customers to charge during off-peak times (defined as  
3 9:00 P.M. to 1:00 P.M. on weekdays), or the EV Demand Response Program, which  
4 incentivizes customers to limit charging on system peak days (typically in the summer).

5 The minimum enrollment period in one of the Company's managed charging programs is  
6 expected to be 12 months, with an option to opt out after the 12-month period. The  
7 Company will consider good cause exceptions to the managed charging enrollment  
8 requirement for a portion of customers in 2-4-unit properties because they have shared  
9 parking or do not own or lease an EV.

10 **Q. Please describe the Residential Charger Rebate offering.**

11 A. The Company is proposing a Charger Rebate to support at-home charging by reducing the  
12 costs of managed-charging-capable L2 EVSE. The Charger Rebate will provide a one-time  
13 rebate per residential account to offset the incremental cost difference between a networked  
14 and non-networked L2 EVSE.<sup>70</sup> The rebate would be applied to the purchase of a managed  
15 charging capable L2 EVSE from a QEL that will be developed by the Company. Rebates  
16 would be distributed on a first-come, first-served basis. If this offering is approved, the  
17 Company will conduct a more comprehensive evaluation of EVSE available in the market  
18 and use those results to establish the rebate level and participation requirements. For

---

<sup>70</sup> Based on the Company's analysis of the incremental difference between the average cost of a networked and non-networked L2 charger.

1 purposes of the cost estimate developed for this filing, the Company has assumed a rebate  
2 amount of \$300 per residential account.

3 Customers receiving this rebate would be required to enroll in one of the Company's  
4 managed charging programs (the Off-Peak Rebate Program or the EV Demand Response  
5 Program) for a minimum of 12 months, with the option to opt out after the 12-month period.

6 **Q. Are there unique benefits provided to LI/EJC customers?**

7 A. Yes, the Company expects LI/EJC customers to be eligible to receive no cost managed  
8 charging capable L2 EVSE and residential make-ready infrastructure, up to \$1,700 for  
9 customers in 1-unit properties, and up to \$2,700 for customers in 2-4-unit properties, not  
10 to exceed actual costs. The LI/EJC EVSE and residential make-ready offering requirements  
11 reflect the same requirements outlined for the Residential Make-Ready Rebate and Charger  
12 Rebate.

13 **Q. How many customers does the Company expect to serve with the Residential Make-  
14 Ready Rebate, Charger Rebate, and LI/EJC offerings?**

15 A. The Company's proposed Residential EV Charging Program targeted at 1-4-unit properties  
16 seeks to enable approximately 20,000 ports at customers' properties. The Residential  
17 Make-Ready Rebate and the Charger Rebate can be "stacked," meaning that customers  
18 would be eligible to obtain both rebates.<sup>71</sup> If a customer receives the LI/EJC offering, they

---

<sup>71</sup> The Company estimates 100% of customers who obtain a Charger Rebate will obtain a Charging Readiness Rebate.

1 are neither eligible to receive the Residential Make-Ready Rebate nor the Charger Rebate  
2 (and vice versa). The offerings are estimated to address approximately 15% of the  
3 customers needed to reach the ZEV MOU light-duty passenger vehicle goal by the end  
4 of 2025.

5 *Five or More Unit Offerings (MUDs)*

6 **Q. Please describe the MUD Make-Ready offering.**

7 A. The Company proposes a make-ready offering to serve MUDs with 5-or-more residential  
8 units. The program will be a revised and significantly expanded version of the Phase I  
9 Program for this segment. The program will provide support in line with the Public and  
10 Workplace offering. The MUD offering will cover 100% of the costs for utility-side make-  
11 ready work, if any. The Company will retain the right to review and deny program support  
12 for high-cost projects. The MUD offering will cover up to 100% of average costs per port  
13 for customer-side make-ready work, but not more than actual costs, with the ability for the  
14 Company to approve up to 150% of the average cost per port on a case-by-case basis.  
15 The program will also provide financial support for qualified EVSE and EVSE installation  
16 and activation costs, budgeted at \$4,000 per L2 port for MUDs located in EJC's (estimated  
17 to be 64% of MUD residential customers)<sup>72</sup> and \$2,000 per L2 port for all other MUDs,  
18 but not more than actual costs. These financial support levels reflect an \$8,000 dual-port  
19 station purchase and installation cost benchmark (\$4,000 per port) and the program funding

---

<sup>72</sup> Company analysis of customer data and expected EJC areas.

1 100% of the cost per port for sites in EJC's and 50% of the cost per port for all other MUDs.  
2 Actual rebates offered may vary over time as the station price benchmark changes and  
3 based upon the availability of third-party funding and customer interest in program. The  
4 Company will offer these rebate levels on all qualified EVSE installed at MUDs and does  
5 not propose any site-level caps on program funding at this time. Customers choosing  
6 qualified networked EVSE may also request support for networking costs. The Networking  
7 Stipend will cover up to \$120 per port per year for four years. Combined, the program's  
8 financial support is estimated to cover 85% of average infrastructure and EVSE installation  
9 costs and likely 100% for EJC sites.

10 **Q. Please describe the EV Ready Site Plan offering.**

11 A. To help larger MUDs gain comfort with installing EVSE, reduce costs, and plan for future  
12 EVSE growth, the program will offer financial support for EV Ready Site Plans. EV Ready  
13 Site plans will create a plan for the infrastructure, EVSE, and management practices  
14 required to provide at least one L2 EV Ready parking spot per housing unit located on the  
15 property (or 100% of resident parking spaces if there are fewer parking spaces than housing  
16 units). "L2 EV Ready" means the parking space features a nearby energized outlet with a  
17 cover that provides a final connection point in an electrical wiring installation for a L2  
18 EVSE (the term "L2 ports enabled" is also used, such as in the Eversource Phase I EV  
19 Program, to refer to areas with make-ready infrastructure installed but no EVSE installed).  
20 EV Ready Site Plans will be created by qualified charging station installers or electricians  
21 and will adhere to a set of minimum requirements regarding their contents and the cost-

1 saving approaches considered, including a description of the property, number of units,  
2 number parking spots, type of parking (e.g., shared or assigned), and existing electric  
3 service type and remaining capacity; approaches to managing on-site EV loads to minimize  
4 infrastructure costs, sometimes referred to as EV Energy Management Systems; types of  
5 EVSE considered and why they are appropriate for that site, and recommendations  
6 regarding phased implementation approaches (e.g., “install infrastructure for these 20  
7 parking spaces first”). Interested MUD properties with twenty or more housing units are  
8 eligible to do an EV Ready Site Plan. The Company expects to contribute up to \$6,000 per  
9 EV Ready Site Plan and has budgeted for 200 plans over four years.

10 **Q. How will the EV Ready Site Plans support the MUD Make-Ready offering?**

11 A. The EV Ready Site Plans will have three primary benefits. First, they will generate interest  
12 in the offering for larger properties. By having a plan in place, decision makers can become  
13 comfortable with the investments and changes required (i.e., parking management, costs  
14 and pricing of station use, etc.) which will spur interest in the make-ready offering.

15 Second, the site plans will allow the Company to authorize greater investments in make-  
16 ready infrastructure. For MUDs with EV Ready Site Plans, the offering will allow  
17 infrastructure work to support additional EV ready parking spots (beyond any parking spots  
18 installing EVSE) in accordance with their plan. In practice, this will typically mean  
19 installing additional conduit and outlets, sizing the service or electric panel differently to  
20 anticipate future load growth, and supporting on-site EV-related energy management

1 systems, such as power-sharing EVSE. The Company estimates the make-ready costs for  
2 these incremental ports enabled to be lower due to the economies of scale of larger make-  
3 ready projects, offsetting the net costs of offering EV Ready Site Plans.<sup>73</sup>

4 Third, the Company expects site plans to help avoid utility-side infrastructure costs through  
5 the use of EV energy management systems, such as power sharing between EVSE or  
6 devices that support power sharing between EVSE and the rest of the property. This is  
7 particularly important for MUDs as the long-term expectation for EVSE growth is high  
8 and on-site load constraints will be prevalent.

9 **Q. How did the Company size the MUD offerings?**

10 A. The MUD offerings are sized to support up to 2,200 L2 ports installed at approximately  
11 550 sites over four years and another 1,600 L2 ports enabled (with make-ready  
12 infrastructure but without EVSE installed) at sites receiving EV Ready Site Plans, totaling  
13 3,800 ports. These figures were based upon significant year-over-year growth targets  
14 compared to EVSE installations at MUDs during the Phase I Program.

15 **Q. Is the Company applying any lessons learned to the MUD program design?**

16 A. Yes. MUDs are incredibly diverse across their size, density and layout, parking, tenure  
17 (rent/own), resident demographics, and many other factors. In order to achieve these

---

<sup>73</sup> *Estimating EV charging infrastructure costs across major U.S. metropolitan areas*, International Council on Clean Transportation, August 2019, Table 3, at 3. <https://theicct.org/publications/charging-cost-US>

1 ambitious targets, the program needs to be responsive to market and customer feedback.

2 Three lessons learned for MUDs include:

- 3 • Networking costs are a known barrier to installations at MUDs, especially in the  
4 years before EV ownership is common among residents which would allow site  
5 hosts to offset operating costs from station revenue. The Phase III Program will not  
6 require networked chargers at MUDs and will provide limited financial support for  
7 stations that do opt for networked stations (the Networking Stipend).  
8
- 9 • MUDs have been installing an average of 4 ports per site to date, but larger MUDs  
10 will need far more than that in the long term. Further, many sites have been hesitant  
11 to engage due to the uncertainty and costs involved.<sup>74</sup> EV Ready Site Plans will  
12 help address long-term EVSE planning and help decision makers get comfortable  
13 with an EV future.
- 14 • Different parking arrangements, such as shared versus assigned parking, may  
15 warrant different EVSE approaches. In accordance with their EV Ready Site Plans,  
16 the Company will allow MUDs installing EVSE to also install site-appropriate 240-  
17 volt outlets or make-ready infrastructure at additional customer parking spots. This  
18 will allow for different EVSE approaches (e.g., customer-provided EVSE, which  
19 may appeal to buildings with renters, high-turnover, or deeded parking).<sup>75</sup>

20 **Q. What is the Company's proposed budget for the Residential Program?**

21 A. The proposed Residential Program budget is \$64.08 million over the program term, with  
22 \$26.4M going to 1-4-unit properties and \$37.7M going to MUDs. The estimated 1-4-Unit  
23 offerings costs are detailed in Exhibit NG-EVPP-7 and the estimated MUD offerings costs  
24 are detailed in Exhibit NG-EVPP-8.

---

<sup>74</sup> Phase I RY 2 Evaluation Report at 31: "While the program has experienced significant progress in [Program Year 2] for public and workplace stations, progress continues to be slower for MUD stations and DCFC stations."

<sup>75</sup> A Company analysis of American Community Survey data suggests 85% of the Company's MUD residential customers are renters. A detailed review of MUD sites in Company territory further suggests considerable diversity in parking arrangements. <https://www.census.gov/programs-surveys/acs/data.html>

1

**Table 9: Residential Segment Estimated Outcomes and Budget**

Offering	Budget (\$M)	Outcome
<b>1-4-unit Properties</b>		
Residential Make-Ready Rebate	\$16.07	20,250 ports enabled.
Charger Rebate	\$2.35	
LI/EJC Offering	\$3.97	
Program admin. & Marketing	\$4.00	
<b>5+ Unit Properties (MUDs)</b>		
Utility-side Make-ready	\$4.43	3,800 L2 ports, with 2,200 ports installed and 1,600 enabled.
Customer-Side Make-ready	\$21.36	
EVSE Rebates	\$8.05	
Program admin. & Marketing	\$2.64	
<b>20+ Unit Properties</b>		
EV Ready Site Plans	\$1.20	200 EV Ready Site Plans
<b>Total Residential Program</b>		
Total	\$64.08	

2 **Q. How do the Residential offerings meet the Department’s standard of review for utility**  
3 **EV proposals?**

4 A. The Company has analyzed evidence on EV sales, charging and travel behaviors, and  
5 trends for future EV technology to inform its Residential offerings. Given the importance  
6 of at-home charging to enable greater levels of EV adoption, the difficult path to installing  
7 and operating EVSE for many residential customers, and the long-term infrastructure cost  
8 reductions possible via well-planned at-home charging, the Company has a unique and  
9 important role to reduce station installation costs, directly enable a large number of

1 installations, and anticipate and manage the associated grid-impacts. This is a role that will  
2 not otherwise be met by the private market. Failure to support customers in addressing  
3 these barriers will result in far slower and less-equitable EV adoption than the  
4 Commonwealth's policy goals demand and will result in more public EVSE required to be  
5 built. The Company's Residential offerings are aimed at addressing existing barriers to  
6 enabling at home charging, particularly in MUDs, which have been harder to reach in the  
7 Company's prior programs. The Company has also proposed an increased focus on serving  
8 low-income and EJC customers through the Residential offerings. The Company has also  
9 coordinated with Eversource and Unitil to provide consistent approaches for incentives and  
10 site host recruitment and to ensure that the EDCs' incentives are complementary, not  
11 duplicative. The Company has also proposed program requirements to avoid overlapping  
12 EV charging incentives. Lastly, the Company has appropriately sized the Residential  
13 segment to advance EVSE availability consistent with meeting the Commonwealth's near-  
14 term emissions reductions goals, without over-serving the market in a way that could  
15 hinder the development of the competitive charging market.

16 **C. Fleet Segment**

17 **Q. What are the Fleet Segment offerings and what outcomes do they achieve?**

18 A. The Fleet Segment is a comprehensive set of offerings to address fleet customer challenges,  
19 including providing fleet assessment services, providing charging make-ready  
20 infrastructure, providing EVSE rebates, school bus purchase price rebates for EJC schools,  
21 and expanding off-peak charging rebate eligibility to fleet customers (to expand the

1 available load management solutions for fleet customers). This segment accelerates climate  
2 goals, improves community health with cleaner air, provides equitable access to clean  
3 transportation, creates future electric load management capabilities & insights for long-  
4 term EV planning, and supplies crucial tools & services for fleets to accelerate their clean  
5 transportation transition. Fleet Segment cost estimates and assumptions are detailed in  
6 Exhibit NG-EVPP-9.

7 Fleet vehicles are a crucial segment to electrify in order to meet the Commonwealth's  
8 goals, and the program enables over 3,500 electric fleet vehicles, providing substantial  
9 benefits to all community members through Carbon Dioxide ("CO<sub>2</sub>") emission reduction,  
10 air pollution reduction, and equitable access to clean transportation:

- 11 ○ **CO<sub>2</sub> reduction:** On a per vehicle basis, fleet vehicles emit more CO<sub>2</sub> than  
12 passenger vehicles – fleet LDVs typically travel twice the annual miles as passenger  
13 vehicles (and therefore emit twice the CO<sub>2</sub>), and MHDVs emit 8-30 times the  
14 amount from a personal LDV.
  - 15 ■ MHDV fleet vehicles have a dramatic impact on the state's emissions:  
16 MHDVs account for approximately 3% of the Commonwealth's on-road  
17 vehicles but are approximately 6% of the vehicle miles traveled ("VMT"),  
18 and approximately 29% of the on-road CO<sub>2</sub> emissions.<sup>76</sup>
  - 19 ■ MHDV CO<sub>2</sub> emissions have doubled since 1990, growing from  
20 approximately 19% to 29% of on-road CO<sub>2</sub> emissions.<sup>77</sup>
- 21 ○ **Pollution reduction:** Particulate Matter 2.5 (PM<sub>2.5</sub>) is the largest environmental  
22 health risk factor in the US (responsible for more than 60% of the deaths from

---

<sup>76</sup> Transportation Sector Report: A Technical Report of the Massachusetts 2050 Decarbonization Roadmap Study December 2020, at 40; <https://www.mass.gov/doc/transportation-sector-technical-report>

<sup>77</sup> Id.

1 environmental causes)<sup>78</sup>, and fleet vehicles have a disproportionate health impact –  
2 fleet LDVs typically have twice the PM<sub>2.5</sub> emissions of passenger vehicles, and  
3 MHDVs are 30-150 times worse per vehicle<sup>79</sup>.

- 4       ▪ PM<sub>2.5</sub> reduction can provide local and immediate health benefits – the  
5       American Lung Association estimates the state could save approximately  
6       \$1B in health costs annually in 2050 with a transition to clean  
7       transportation<sup>80</sup>, and PM<sub>2.5</sub> represents approximately 83% of the air  
8       pollution savings from ICE conversion.
- 9       ○ **Equitable access to clean transportation:** Every community member deserves  
10      clean air and access to clean transportation vehicles, for both their own  
11      transportation needs and from the goods and services operated in their community.  
12      The Company expects to deploy more than 40% of its Fleet infrastructure  
13      investment in EJC communities, in addition to the EJC electric school bus rebate  
14      program.
- 15      ▪ The Commonwealth’s EJC communities suffer disproportionate pollution  
16      impacts: Black, Asian, and Latinx residents are exposed to approximately  
17      30% more vehicle pollution than white residents, while almost 70% of all  
18      white residents live in areas with concentrations below the state average.

19 **Q. What are the main components of the Fleet Segment?**

20 A. The Fleet Segment consists of five main components:

- 21 1. **Fleet Make-Ready Offering (Fleet Make-Ready):** Support for up to approximately  
22 600 EVSE ports (approximately 70% L2, 30% DCFC) to enable approximately 2,000  
23 fleet EVs in the Company’s territory (approximately 1,150 LDV, 850 MHDV).
- 24 2. **EVSE Rebate Offering:** Support for 50% of EVSE costs for all fleet customers, and  
25 100% of EVSE costs for EJC-eligible fleet customers.
- 26 3. **Fleet Assessment Services Offering:** Provide Fleet Assessment Services for up to 150  
27 private & non-profit fleet customers and expand the Company’s Phase II Fleet

---

<sup>78</sup> Union of Concerned Scientists, Inequitable Exposure to Air Pollution from Vehicles in Massachusetts, June 2019, at 2; <https://www.ucsusa.org/sites/default/files/attach/2019/06/Inequitable-Exposure-to-Vehicle-Pollution-MA.pdf>

<sup>79</sup> U.S. Environmental Protection Agency, Office of Transportation and Air Quality, Apr. 6, 2018, Table 4-43; <https://www.bts.gov/content/estimated-national-average-vehicle-emissions-rates-vehicle-vehicle-type-using-gasoline-and>

<sup>80</sup> American Lung Association, The Road to Clean Air: Benefits of a Nationwide Transition to Electric Vehicles, September 2020, at 10; <https://www.lung.org/getmedia/99cc945c-47f2-4ba9-ba59-14c311ca332a/electric-vehicle-report.pdf>.

1 Assessment Services provided to public fleets to include 25 additional assessments in  
2 2025. In addition, the program will develop online self-assessment tools for customers  
3 to conduct fleet electrification planning and estimate TCO savings.

4 4. **EJC School Bus Rebate Offering:** Provide approximately 300 school bus rebates for  
5 schools operating in EJCs to cover the incremental purchase price of an electric school  
6 bus. The 300 buses will be scaled up over four years to a level that is approximately  
7 equal to one year of procurement for all EJC school districts in the Company's territory.

8 5. **Off-Peak Charging Rebate Offering:** Provide operating costs saving opportunities  
9 by expanding eligibility for the existing off-peak charging rebate offering to include up  
10 to 1,000 fleet and MHDVs, such as trucks and buses.

11 **Q. How did the Company determine the components to achieve these outcomes?**

12 A. The Fleet Segment is a holistic approach to enabling both LDV and MHDV fleet  
13 electrification and is designed to meet the Commonwealth's clean transportation and  
14 climate goals while solving the fleet customer challenges outlined in Section III above. The  
15 sizing methodology, scale, eligibility requirements, incentive levels, and lessons learned  
16 from prior programs are described below.

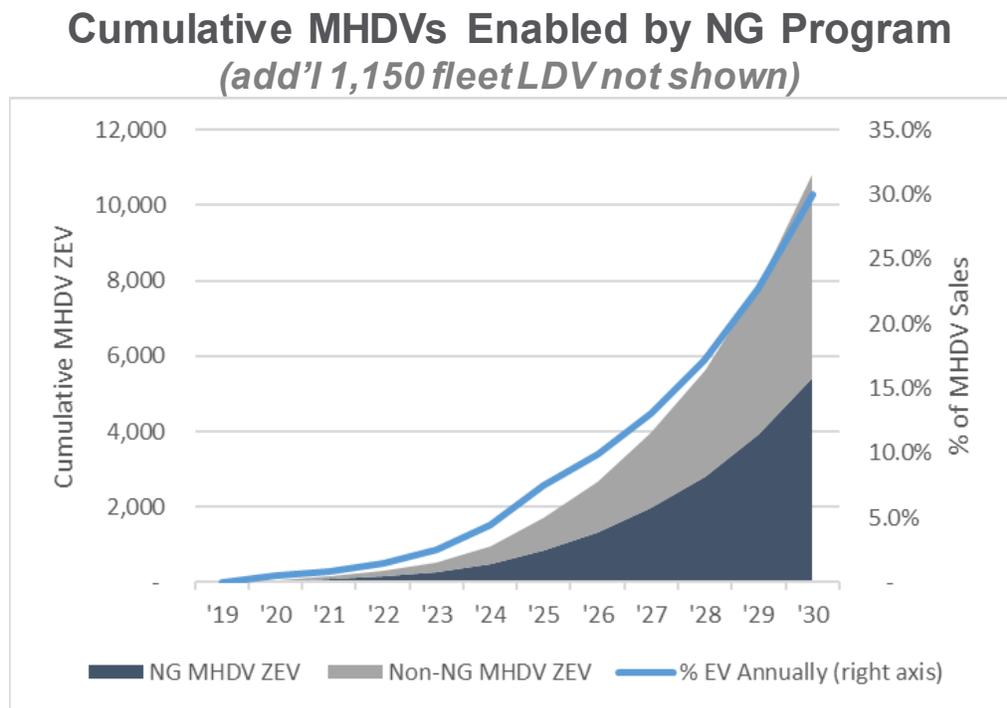

17 ***Methodology and Scale:***

18 1. **Fleet Make-Ready:** The Fleet Make-Ready offering provides support for make-ready  
19 charging infrastructure to accelerate both the LDV and MHDV ZEV MOU goals.

20 a. MHDVs: Less than 1% of the current approximately 98,000 MHDV fleet  
21 vehicles in the Company's territory are currently ZEV. The MHDV ZEV MOU  
22 requires approximately 3,000 annual MHDV ZEV sales in MECO in 2030  
23 (30% of approximately 10,000 annual sales). To stay on pace to reach 30% of  
24 new sales by 2030, the Company estimates approximately 750 annual MHDV  
25 ZEV sales in MECO in 2025 (7.5% of approximately 10,000 annual sales). The

1 Fleet Make-Ready offering enables approximately one-half of the necessary  
 2 new sales in the territory, scaling to ~3.75% of new MHDV sales in 2025 (~370  
 3 MHDV ZEVs sold in 2025). Cumulatively, the Company enables a total of  
 4 approximately 850 MHDV ZEVs in its territory (approximately 50% of the total  
 5 estimated MHDV ZEV vehicles in the territory).

6 **Figure 1: MHDVs Enabled by Fleet Segment Offerings**

7

8 b. LDVs: Similarly, less than 1% of the commercial LDVs are currently ZEV (537  
 9 in 2019). The Fleet Make-Ready offering enables LDV fleet vehicles to grow  
 10 to approximately 8% of annual sales in 2025 and enables the infrastructure for

1 25% of those vehicles. Cumulatively, this represents make-ready infrastructure  
 2 to support approximately 1,150 LDVs.

3 2. **EVSE Rebates:** EVSE costs typically represent more than 30% of the total  
 4 infrastructure costs,<sup>81</sup> and are often a limiting factor for customer ZEV adoption,  
 5 particularly for MHDV fleets that are installing higher power level EVSE. In line with  
 6 the Public and Workplace Make-Ready offering, the Company proposes the following  
 7 EVSE rebates for fleet customers:

8 **Table 10: Fleet Segment EVSE Rebates**

EVSE Type	EJC Fleets	Non-EJC Fleets
L2	Up to \$4,000 / port	Up to \$2,000 / port
DCFC	Up to \$80,000 / port	Up to \$40,000 / port

9  
 10 3. **Fleet Assessment Services:** The Company has assessed the fleet customers in its  
 11 territory and is proposing fleet assessment services for up to 150 private and non-profit  
 12 fleet customers. This is in addition to the Company's Fleet Assessment Services  
 13 provided to 100 public customers currently in progress. The services would be targeted  
 14 to customer segments, including but not limited to: corporate, delivery, private  
 15 transport, refuse, and general services. Within those segments, there are more than 150

---

<sup>81</sup> 81 Phase I PY2 Evaluation Report, Section 4.2.2

1 customers with fleets larger than 100 vehicles, and more than 450 customers with fleets  
2 larger than 50 vehicles.<sup>82</sup>

3 In addition, the Company proposes to develop online fleet planning and TCO tools for  
4 fleet customers. Standardized reports and scalable educational tools are key factors in  
5 a fleet operator’s decision-making process, and these tools help fleet customers of all  
6 sizes transition to clean transportation, providing services including (but not limited  
7 to): Fleet Make-Ready offering eligibility, vehicle availability, funding options,  
8 infrastructure and EVSE choices, fuel savings calculator, TCO estimates, and electric  
9 rate summaries. This offering is built in response to the Company’s engagement with  
10 fleet customers, industry stakeholder events, and experience with current fleet  
11 assessment services programs in its Massachusetts and Rhode Island affiliate’s service  
12 territories. In order to maintain a consistent customer experience for fleet operators  
13 across the state, the Company will collaborate with Eversource to ensure the  
14 capabilities and user experience are consistent for fleet customers in both territories.

15 **4. EJC School Bus Rebates:** Massachusetts has more than 9,000 school buses, and the  
16 Company has more than 4,000 in its territory (Gross Vehicle Weight Rating (“GVWR”)  
17 Classes 6-8). Providing 300 incremental cost rebates for school buses operating in EJC’s  
18 is less than 8% of those buses. The 300 buses will be scaled up over the four years of  
19 the offering, to a level that is approximately equal to one year of procurement for all

---

<sup>82</sup> IHS-Polk

1 EJC school districts in the Company's territory. Approximately 40% of the Company's  
2 residents live in EJC's, and school buses are typically replaced on a ten-year cycle, so  
3 replacing one full year of EJC school districts is approximately 160 buses. The EJC  
4 school bus rebate offering is projected to support 20 school buses in 2022, 40 in 2023,  
5 80 in 2024, and 160 in 2025.

6 School buses are a vital segment to support during the transition to clean transportation,  
7 for several reasons:

- 8 a. Local air pollution affects student performance as well as public health. For  
9 example, The Union of Concerned Scientists notes that chronic exposure to  
10 Particulate Matter (PM<sub>2.5</sub>) air pollution in children has been linked to slowed  
11 lung-function growth and the development of asthma, among other negative  
12 health impacts, and school buses have a disproportionate negative impact  
13 because of the faster breathing rate of children, the idling of school buses, and  
14 the stop/start nature of bus route operation.<sup>83</sup>
- 15 b. School districts continue to identify the upfront capital costs for electric school  
16 buses as one of the largest barriers to adoption during discussions with the  
17 Company, particularly as they collaborate with school bus solution providers to  
18 consider implementing large-scale projects.

---

<sup>83</sup> Union of Concerned Scientists, *Inequitable Exposure to Air Pollution*, at 10.

1 c. Electric school buses have a large future potential benefit via vehicle grid  
2 integration (“VGI”), and the Company sees opportunity to have visibility into  
3 future opportunities for real-time curtailment, peak management, vehicle-to-  
4 grid (“V2G”), and duty cycle optimization solutions in the long term.

5 Because the school bus market represents a relatively new sector of electric vehicles,  
6 the Company will evaluate the deployment of these 300 rebates as part of the mid-term  
7 review. The Company is including all 300 vehicles in this proposal, because it is crucial  
8 to provide long-term transparency to local school boards and city councils as they  
9 consider their long-term school bus fleet electrification plans in their budgeting  
10 processes in 2022 and 2023.

11 5. **Off-Peak Charging Rebates:** This Fleet Segment expands the eligibility for the off-  
12 peak charging rebate offering approved in the Phase II program, to include up to 1,000  
13 fleet MHDVs in addition to the up to 11,000 residential EVs approved in D.P.U. 18-  
14 150. This enables the Commonwealth to meet both of its ZEV MOU goals and provides  
15 significant peak load reduction as larger fleets electrify. It allows the Company to gain  
16 the insights and experience necessary to develop new time-of-use rates for fleet  
17 customers. This program expansion is discussed in more detail in Section D.

18 **Q. Please describe the incentive structure for the Fleet offerings.**

19 A. To meet the Commonwealth’s clean transportation goals, the Fleet offerings will provide  
20 holistic support to fleet customers. The levels of support are summarized in the table below:

1

**Table 11: Overview of Fleet Segment Offerings**

	<b>Fleet Assessment Services</b>	<b>Fleet Make-Ready</b>	<b>EJC School Bus Rebates</b>
Ports / Vehicles Supported	~150 private & non-profits, 25 incremental public fleets, and tools & support for fleets of all sizes ~2,625 vehicles	~600 Ports (~30% DCFC + ~70% L2) ~850 MHDV ~1,150 LDV	300 buses
Incentive Levels	50% cost for private No-cost for non-profit and public	Up to 100% Make-Ready (Utility- and Customer-side) Up to 50% EVSE rebate	Incremental cost: up to ~\$175,000 / bus
EJC Support	Target 40% EJC fleets	Expect 40% of ports in EJCs Up to 100% Make-Ready and EVSE Rebate	Schools or contractors that serve primarily EJC communities

2 **Q. Are private and public fleets eligible for the Fleet Make-Ready offering?**

3 A. Yes. In order to accelerate fleet EV deployments as rapidly as possible, the Fleet Make-  
 4 Ready offering is designed to support the needs for both private and public fleets. As part  
 5 of its ongoing interactions with stakeholders, and to ensure equitable distribution of the  
 6 Fleet Segment support funding, the Company will monitor and adjust the allocation of  
 7 funds to projects in order to maintain an equitable distribution to a diverse set of customers  
 8 and projects (e.g., limiting support for a specific private fleet project if that customer  
 9 segment has received an unbalanced portion of the Fleet Make-Ready offering funds).

10 For fleets to be eligible for the EJC level of support, fleet operators must either be registered  
 11 in or operate more than 50% of the time within census block groups that meet any of the  
 12 Commonwealth’s EJC definitions. This expands on the Commonwealth’s eligibility for the

1 MOR-EV Trucks program, which includes census block groups within the income  
2 eligibility component of EJC definition.

3 **Q. Is the Company utilizing lessons learned in the Fleet Segment design?**

4 A. Yes. The Company will draw upon successes from prior efforts, both in Massachusetts and  
5 in its affiliates' service territories in New York and Rhode Island. These lessons include:

- 6 • Fleet Assessment Services programs identify significant opportunities for electric  
7 transportation. Phase I of the Company's Fleet Assessment Services Program  
8 (concluded in April 2021) has shown substantial TCO savings, lifetime emissions  
9 reduction, and vehicle conversion potential as part of the first 10 customers  
10 assessed. Collectively, 773 vehicles were found to be cost effective in a transition  
11 to EVs, representing approximately 35% of the 2,240 vehicles analyzed. Those 773  
12 vehicles could require up to 770 EVSE ports and represent more than \$40 million  
13 in net present value of TCO savings and more than 160 thousand metric tons of  
14 CO<sub>2</sub> eliminated over the lifetime of the vehicles. In addition, 9 of the 10 fleets  
15 operate in EJCs, tripling the 30% EJC target of the Phase 1 Fleet Assessment  
16 Services Program. These findings are encouraging and serve as both an indicator  
17 of future success in the proposed expansion of the Fleet Assessment Services, as  
18 well as a pipeline for the Fleet Make-Ready offering.
- 19 • Ongoing fleet customer support is crucial. Fleets considering electric transportation  
20 options have significant questions, including vehicle performance, grid upgrade  
21 costs, fuel cost changes, and operational changes. These customers need technical  
22 assistance from beginning to end for EVSE installation and choosing EVs, and  
23 these attributes are a key driver of expanding the Company's Fleet Assessment  
24 Services and online tools for fleet customers.
- 25 • Developers appreciate insight into the long-term plans of fleet customers, and fleet  
26 assessments provide an accurate and reliable pipeline of future electrification  
27 projects.
- 28 • Flexibility in EVSE technology and vehicle availability is crucial. The EV  
29 marketplace, especially in the MHDV space is rapidly evolving, and the Fleet  
30 Make-Ready offering is designed to adapt to changing market conditions as the  
31 Company's fleet customers progress through a transition to electric fleet vehicles.
- 32 • Right sizing vehicles for specific use cases is important for some fleet operators,  
33 and specific requirements can vary based on individual fleet performance needs.

Fleet Assessment Services	~\$3.25	<ul style="list-style-type: none"> <li>• 150 private &amp; non-profit fleet assessments</li> <li>• 25 incremental public fleet assessments in 2025 (beyond 100 fleets in Phase II)</li> <li>• Online fleet electrification planning and TCO savings tools</li> </ul>
Utility-Side System Expansion	~\$15.00	<ul style="list-style-type: none"> <li>• System upgrades to accommodate estimated large-scale fleet loads</li> </ul>

Segment Total	~\$98.23	

1 **Q. How does the Fleet Segment meet the Department’s standard of review for EV**  
 2 **proposals?**

3 A. The Company has used its experience in providing make-ready infrastructure, support, and  
 4 assessment services to fleet operators in its territory throughout the northeast to inform this  
 5 Fleet Segment design. Fleet LDVs and MHDVs represent more than 30% of the  
 6 Commonwealth’s CO<sub>2</sub> emissions, and therefore represent a significant portion of the  
 7 public’s interest in clean transportation solutions. In addition, the current needs of fleet  
 8 operators in the Commonwealth are not being met entirely by the private market, and this  
 9 proposed Fleet Segment provides the holistic infrastructure support, assessment services,  
 10 and EVSE rebates necessary to effectively scale the fleet vehicles to meet ZEV goals.  
 11 Finally, these fleet offerings are designed to be complementary to existing services from  
 12 the private market, as the infrastructure support, incentives, and rebates will complement

1 and accelerate the rapidly evolving technology solutions and business models of the private  
2 market.

3 **D. Off-Peak Charging Rebate Program**

4 **Q. Please describe the Company's efforts to integrate EV charging into the electric grid.**

5 A. EV charging presents multiple challenges and opportunities for the electric grid. The  
6 Department has acknowledged the importance of managing EV charging in approving the  
7 Company's Off-Peak Charging Rebate Program in D.P.U. 18-150 and again recently in  
8 D.P.U. 20-69-A.<sup>84</sup>

9 The Company supports a layered approach to integration of EV charging, including pricing  
10 signals (i.e., through cost-based and time-varying price signals), thoughtful infrastructure  
11 planning at the site, distribution, and system levels, and customer-facing education and  
12 load management programs (i.e., the off-peak rebate and demand response programs).  
13 Bidirectional V2G or vehicle-to-home (V2H) technologies add even more opportunities to  
14 reduce infrastructure and energy costs, reduce customer bills, support energy resiliency,  
15 and more. The supporting hardware, software, policies and procedures, and customer  
16 acceptance for smarter EV integration are quickly evolving, highlighting the need to test  
17 and adapt these approaches over time.

---

<sup>84</sup> Grid Modernization, D.P.U. 20-69-A Order at 47-48 "It is important that electric vehicle customers are provided with appropriate pricing signals, through load management incentive programs, to encourage the electric vehicle charging behavior that will advance the Commonwealth's climate goals and the Department's grid modernization objectives."

1 In the Phase III Program, the Company is supporting EVSE integration in several ways,  
2 including support for EV Ready Site Plans for MUDs, Fleet Assessment Services, rebates  
3 for managed charging capable L2 EVSE for residential customers, and, as described below,  
4 a proposed expansion of the Company’s current Off-Peak Charging Rebate Program.

5 **Q. Please describe the current Off-Peak Charging Rebate Program.**

6 A. In D.P.U. 18-150, the Department approved the Company’s Phase II Off-Peak Charging  
7 Rebate Program for residential EV customers, providing three or five-cent per kWh rebates  
8 for EV charging occurring during off-peak hours (9:00P.M. to 1:00P.M.). The program  
9 pursues three main benefits: 1) shifting EV charging off-peak to avoid increases in peak  
10 demand; 2) evaluating the responsiveness of EV customers to time-differentiated price  
11 signals to inform future time-varying rate design; and 3) evaluating technologies to monitor  
12 charging that can be used to inform future offerings.<sup>85</sup>

13 In approving the Off-Peak Rebate Charging Program, the Department said “the Company  
14 will be able to gain experience and gather data necessary to develop new time-of-use rates  
15 for EV customers in the future. Further, we expect the Company to use the information and  
16 results from this incentive program to develop new load management techniques and  
17 mechanisms as EV penetration increases.”<sup>86</sup>

---

<sup>85</sup> D.P.U. 18-150, at 340-341.

<sup>86</sup> D.P.U. 18-150, at 388-389 (internal citations omitted).

1 The Company launched the Off-Peak Rebate Charging Program in September 2020,  
2 enrolling over 500 residential customers in the program. The Company is tracking charging  
3 behavior by on-peak and off-peak, by vehicle type, by at-home versus away-from-home,  
4 and more. The Company recently filed an initial analysis with the Phase II Program  
5 evaluation report.<sup>87</sup> The initial analysis details a review of the participants’ baseline  
6 charging data and concludes some key findings that will be considered as the company  
7 continues to administer the program. The Company is currently planning to grow the  
8 customer enrollment and methods by which customers can participate after selecting a new  
9 implementation vendor in the second half of 2021.

10 **Q. What new objectives does the Company hope to pursue through the expanded Off-**  
11 **Peak Charging Rebate Program?**

12 A. There are several important, near-term research objectives regarding time-varying rate  
13 design, load management techniques, and enabling technologies that require additional  
14 Department approval to pursue within the existing Off-Peak Rebate Charging Program.  
15 Specifically, the Company is interested in understanding and testing automated “flexible  
16 scheduling” approaches to shift more charging off-peak. In addition, the Company is  
17 interested in understanding and testing approaches to prevent or mitigate the impacts of  
18 “timer peaks,” where EV charging can cause spikes in demand at the beginnings or ends  
19 of the off-peak window (in this case, 9:00 P.M.).

---

<sup>87</sup> D.P.U 21-67 Exhibit NG-MM-9 Off-Peak Charging Rebate Program Evaluation Memo.

1 Further, the Company proposes to expand the scope of the program beyond the D.P.U. 18-  
2 150 Order by:

- 3 1. extending the Off-Peak Charging Rebate Program through 2025 in order to align  
4 with the timeline of the other segments proposed in the Phase III Program; and
- 5 2. expanding the Off-Peak Charging Rebate Program to include up to 1,000 additional  
6 fleet EVs.

7 These proposed revisions and expansions are described below in more detail and are  
8 consistent with the Department's recent guidance on charging incentive programs.<sup>88</sup> The  
9 Company notes there are many other potential objectives and demonstrations around EVs,  
10 managed charging, time-varying rates design, and load management techniques it may  
11 wish to pursue in the future or through other means. However, at this time the Company  
12 believes these are important new objectives on managing EV charging that can leverage  
13 the already-approved Off-Peak Charging Rebate Program.

14 **Q. Please describe the proposed revision around flexible scheduling of EV charging.**

15 A. The Company proposes to include within the Off-Peak Charging Rebate Program  
16 automated, flexible scheduling of EV charging functionality for customers. Flexible  
17 scheduling is defined here as scheduling and synchronizing customer charging to optimize  
18 off-peak charging performance.

---

<sup>88</sup> D.P.U. 20-69-A Order at 47-49.

1 The need for flexible scheduling is evident from two results in the Company’s affiliate,  
2 The Narragansett Electric Company’s, similarly designed SmartCharge Rhode Island  
3 program. First, timer peaks are shown by the purple ‘treatment’ line in Figure 2 below,  
4 relative to the ‘unmanaged’ load profile in blue.<sup>89</sup> Timer peaks have been documented  
5 elsewhere also.<sup>90</sup> Timer peaks can initially cause issues at the local distribution level, such  
6 as service transformers and secondary conductors.<sup>91</sup> In the future, if left unmanaged, timer  
7 peaks could cause both feeder and system-level issues as well. Second, the SmartCharge  
8 Rhode Island program documented that participants continue to charge roughly 30% of  
9 their kWh on-peak, even with the off-peak incentive.<sup>92</sup> Active scheduling of EV charging  
10 is a leading possibility to mitigate these timer impacts and increase the share of charging  
11 off-peak, in addition to potential other benefits, and could be tested via the Off-Peak  
12 Charging Rebate Program with the Department’s approval.

13 This program modification would be accomplished by allowing customers in the Off-Peak  
14 Charging Rebate Program to opt-in to a “flexible scheduling” service, expected to be  
15 provided by the same third-party implementation vendor the Company will select later this

---

<sup>89</sup> RI RY2 Evaluation Report, Figure 1 . Further, a key finding of that report was “National Grid will need to investigate technologies and incentives to mitigate and manage any timer or rebound peaks induced from TOU rates.” Id. at 5. page 5)

<sup>90</sup> A Comprehensive Guide to Managed Charging, SEPA, May 2019, page 15. <https://sepapower.org/resource/a-comprehensive-guide-to-electric-vehicle-managed-charging/>

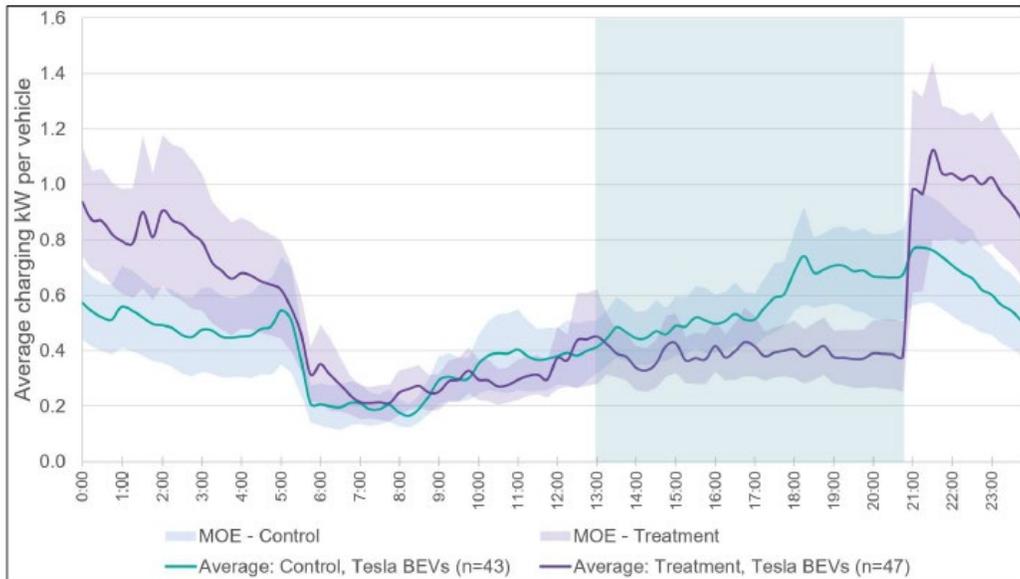

<sup>91</sup> Muratori, M. Impact of uncoordinated plug-in electric vehicle charging on residential power demand. *Nat Energy* 3, 193–201 (2018). <https://doi.org/10.1038/s41560-017-0074-z>

<sup>92</sup> RI RY2 Evaluation Report Table 4-19.

1 year. Customers will let the vendor schedule their charging to help maximize their off-peak  
2 charging rebates, while always having the option to override that schedule and charge on-  
3 demand. In return, the vendor’s technology platform will synchronize charging to both  
4 increase the share happening off-peak (and thus maximize the customer’s off-peak rebates)  
5 and do so in a way that avoids timer peaks.

6 The research effort would help inform time-varying rate designs (e.g., defining off-peak  
7 time-period windows), the technical potential and effectiveness of load management  
8 techniques to mitigate the impacts of timer peaks, customer acceptance of such charging  
9 scheduling solutions, and more.

10 **Figure 2: Charging Load Profile Comparing Control (Blue) and Treatment (Purple)**  
11 **- Tesla BEVs**

1 **Q. Does the Company wish to extend the Off-Peak Charging Rebate Program through**  
2 **2025 for passenger EVs?**

3 A. Yes. The Company is requesting authorization to extend the Off-Peak Charging Rebate  
4 Program through 2025 to ensure that the program is aligned with the duration of the Phase  
5 III Program proposed in this filing, particularly the 1-4-unit residential rebates which  
6 enable at-home charger installations and require participation in a charging incentive  
7 program.

8 **Q. Does the Company wish to extend the Off-Peak Charging Rebate Program to include**  
9 **fleet EVs?**

10 A. Yes. The Company proposes to expand eligibility for the Off-Peak Charging Rebate  
11 Program to include light, medium, and heavy-duty fleet vehicles for 2022 through 2025.  
12 The program would keep the same program and rebate design and implementation vendor.  
13 Including fleet vehicles provides these primary benefits:

- 14 • accelerating the adoption of MHDVs, enabling the state to meet its ZEV MOU  
15 goals of 30% of new sales by 2030;
- 16 • increasing the rate of CO<sub>2</sub> emissions reduction in the program – vehicles above  
17 10,000 pounds (GVWR classes 3-8) reduce between 6 and 29 times the amount of  
18 CO<sub>2</sub> per vehicle, as compared to passenger BEVs;
- 19 • increasing the rate of air pollution reduction in the program – vehicles above 10,000  
20 pounds (GVWR classes 3-8) reduce between 30 and 150 times the amount of  
21 Particulate Matter 2.5 (PM<sub>2.5</sub>) per vehicle, as compared to passenger BEVs; and
- 22 • expanding the program’s sample for research and testing to include passenger fleet  
23 vehicles and MHDVs, which are not currently eligible to participate. The Company  
24 may be able to understand the behaviors of a greater variety of EV use cases,  
25 including but not limited to: municipal LDV fleets, corporate LDV fleets, delivery  
26 vehicles, buses, and freight trucks. Fleet and MHDVs have significantly different  
27 use cases, less flexibility on when and where to charge, and larger peak charging  
28 loads compared to passenger vehicles.

1 Including fleet and MHDVs in the Off-Peak Charging Rebate Program allows the  
2 Company to develop and apply lessons learned from all vehicle types to future EV  
3 programs.

4 Additionally, the similarly designed SmartCharge New York program run by Consolidated  
5 Edison in the New York City region went through a similar expansion several years ago.  
6 The New York Public Service Commission approved an expansion of that program to  
7 include Fleet and MHDVs after initially approving a residential-only program, a decision  
8 that affirmed many of the benefits and reasons described above.<sup>93</sup> Incorporating these Fleet  
9 and MHDVs into the Off-Peak Charging Rebate Program allows the Company to greatly  
10 expand the benefits of the off-peak program to all vehicle types and incorporate those  
11 findings into future programs as EVs grow to meet the Commonwealth’s climate goals.

12 **Q. How will the expanded Off-Peak Charging Rebate Program address EV charging in**  
13 **multiple service territories?**

14 A. The Department recently indicated that any future charging incentive proposals must  
15 “address issues related to customers charging their electric vehicles in multiple service  
16 territories.”<sup>94</sup> The ability and need to differentiate EV charging by location depends upon  
17 the monitoring technologies used and what types of charging qualify for incentives. The  
18 Company expects to conduct further analysis to be able to monitor and differentiate at-

---

<sup>93</sup> NY PSC Order in Case 16-E-0060, Order Expanding Electric Vehicle Charging Program Eligibility, Sept 12, 2018.

<sup>94</sup> D.P.U. 20-69-A at 49, note 32.

1 home and away-from-home charging and may also be able to report on in-territory and out-  
2 of-territory charging during the Phase III Program and can report on any findings at a later  
3 date.

4 Currently, in the Phase II Program, the Company offers rebates for any charging during the  
5 hours of 9 p.m. to 1 p.m. Monday through Friday and excluding holidays.<sup>95</sup> The Company  
6 has used, to date, on-board vehicle monitoring, allowing monitoring of all vehicle charging,  
7 in or out of the Company's service territory. Networked EVSE are also capable of  
8 implementing off-peak rebate programs, however, given their fixed locations, would only  
9 capture charging in the Company service territory.

10 The Company does not recommend any changes in how it offers off-peak rebates at this  
11 time as the off-peak rebate amounts, three or five-cents per kWh depending on the season,  
12 were based upon an analysis of ISO New England supply and capacity costs. Given the  
13 high-level geography used in the analysis and data showing that over 80% of charging  
14 occurs at home overall, particularly Monday to Friday when the participants earn off-peak  
15 rebates, the Company does not recommend any changes in how it offers off-peak rebates  
16 at this time.

---

<sup>95</sup> Massachusetts Electric Company and Nantucket Electric Company, Electric Vehicle Program Provision, M.D.P.U. No. 1447, available at [https://www.nationalgridus.com/media/pdfs/billing-payments/tariffs/mae/ev\\_adjmt\\_prov.pdf](https://www.nationalgridus.com/media/pdfs/billing-payments/tariffs/mae/ev_adjmt_prov.pdf).

1 **Q. How will these proposed changes affect the budget of the Off-Peak Charging Rebate**  
2 **offering?**

3 A. The Company can accommodate flexible scheduling functionality within the originally  
4 estimated Off-Peak Rebate Program budget. As described in D.P.U. 18-150-A, the  
5 Department did not approve a specific budget with this program and noted that all costs  
6 would be recovered through the annual cost recovery filings.<sup>96</sup> Further, the Department  
7 noted that it expected the costs of the program to adhere close to the Company's estimated  
8 budget,<sup>97</sup> about \$5.6 million through the approved program term ending  
9 September 30, 2024. Thus, the Company requests that it be allowed to test and implement  
10 flexible scheduling approaches within the Off-Peak Charging Rebate Program and that it  
11 be allowed to include any direct costs in its cost recovery filings (e.g., added vendor fees),  
12 but the Company is not requesting an incremental budget beyond \$5.6 million to be able  
13 to integrate flexible scheduling in the Off-Peak Charging Rebate Program.

14 The Company is requesting to increase the estimated budget by \$2.25 million to extend the  
15 Off-Peak Charging Rebate Program for residential customers through 2025 and an  
16 additional \$1.58 million to allow the participation of fleet EVs. The extension of the current  
17 program through 2025 assumes the program cap remains at 11,000 residential customers.

18 The added costs for the fleet vehicles are needed to accommodate both the increase in

---

<sup>96</sup> D.P.U. 18-150-A at 19-20.

<sup>97</sup> D.P.U. 18-150-A at 20. "The Department expects any variance between those estimated costs and actual costs would be minimal."

1 participation over and above the passenger vehicles accounted for in D.P.U. 18-150 and  
 2 the larger energy demand and associated off-peak rebates of fleet and MHDVs.

3 In summary, the Company requests approval to implement flexible scheduling and requests  
 4 an increase in the estimated budget to accommodate the program extension through 2025  
 5 for passenger vehicles and participation of fleet vehicles, as shown in Table 13. The  
 6 changes proposed here would be implemented as revisions to the EV Program Factor tariff,  
 7 amending the section currently titled “Residential Off-Peak Charging Rebate.” The  
 8 estimated Off-Peak Charging Rebate Program costs are detailed in Exhibit NG-EVPP-10.

**Table 13: Summary of Off-Peak Charging Rebate Program Offering Requested**  
**Revisions**

Off-peak Rebate Program	2020	2021	2022	2023	2024	2025
Residential EVs	Approved in 18-150 (\$5.6M) <i>Request for flexible scheduling ability via Phase III.</i>					Phase III (\$2.2M)
Fleet EVs	n/a		Phase III (\$1.5M)			

11 **Q. How does the expanded Off-Peak Charging Rebate Program meet the Department’s**  
 12 **standard of review for utility EV proposals?**

13 A. The Department’s order in D.P.U. 20-69-A included two directives regarding future  
 14 charging incentive programs to which the expanded Off-Peak Charging Rebate Program  
 15 adheres. First, the Company described earlier how the program currently addresses  
 16 participating customers charging their EVs in multiple service territories and will be able  
 17 to report additional findings on this topic at a later date. Second, the Company will continue  
 18 to adhere to the language in D.P.U. 18-150 regarding overlap between the off-peak rebate  
 19 program and related charging incentive offerings run as part of the Company’s demand

1 response program. Specifically, the Company is only allowing a participant to be enrolled  
2 in one charging incentive program to avoid “duplicate incentives to a customer for the single  
3 action of charging during off-peak hours.”<sup>98</sup> The proposed modifications to the Off-Peak  
4 Charging Rebate Program, including the addition of fleet vehicles and the extension of the  
5 residential program for an additional year will continue to adhere to those requirements.

6 **VII. Transformer Surcharge Waiver for Make-Ready Program Participants**

7 **Q. Why is the Company requesting a waiver of the transformer surcharge of the**  
8 **Company’s General Service – Small Commercial and Industrial G-1 tariff (“Rate G-**  
9 **1”)?**

10 A. The transformer surcharge within the Minimum Charge provision of Rate G-1 exists to  
11 recoup the capital expense associated with the installation of a larger transformer than is  
12 typically needed for a customer of the size receiving electric service on Rate G-1. Since  
13 the make-ready portions of the various components of the EV Phase III Program will pay  
14 for this capital expense just as the make-ready component from the EV Phase I Program  
15 has already paid for this capital expense, there is no need for a transformer surcharge for  
16 these customers. Therefore, Rate G-1 customers that required a larger dedicated  
17 transformer that was funded via make-ready components in the EV Phase I and III  
18 Programs would not be subject to a transformer surcharge, associated with the transformer  
19 paid for by the make-ready program, on their monthly bill going forward.

---

<sup>98</sup> D.P.U. 18-150 at 389.

1 **VIII. Workforce Development and Electrician Training**

2 **Q. Please provide an overview of the Company's proposed Workforce Development and**  
3 **Electrician Training offerings.**

4 A. The EDCs are proposing to co-sponsor two statewide offerings to invest in the EV  
5 workforce of the future. These offerings are 1) a Workforce Development initiative to  
6 support underrepresented entrants to the electric vehicle workforce and 2) an Electrician  
7 Training initiative to upskill incumbent electricians.

8 **Q. Why is Workforce Development and Electrician Training needed?**

9 A. The rapid growth of the EV market emphasizes the importance of understanding its current  
10 workforce and opportunities for continued growth and development. Developing a skilled  
11 workforce is an investment, not a cost.<sup>99</sup> The transition to EVs presents a strong opportunity  
12 to support inclusive, quality jobs for all Massachusetts residents. The Company's proposed  
13 Workforce Development and Electrician Training initiatives help ensure future EV  
14 workforce entrants and incumbent electricians have access to developing the needed  
15 skillsets and technical knowledge to be included in the EV transition. To reach the  
16 ambitious port targets proposed in the Phase III Program, as well as provide a positive  
17 customer experience, the Company views workforce development and electrician training  
18 as necessary. The EV workforce needs to grow over the next four years to meet the demand  
19 created by this proposed Phase III Program. Ensuring a seamless customer experience is

---

<sup>99</sup> California Workforce Development Board, A Jobs and Climate Action Plan for 2030 at ii, available at:  
<https://laborcenter.berkeley.edu/wpcontent/uploads/2020/09/Putting-California-on-the-High-Road.pdf>.

1 imperative to the Company. It is critical that the workforce is knowledgeable about  
2 charging infrastructure and can provide expert advice to customers on the topic.

3 To ensure equity in the EV transition, investments need to be made in both people and in  
4 capital. Charging infrastructure can be viewed by some as a symbol of displacement and  
5 gentrification. Workforce development initiatives targeted at low-income residents and  
6 residents in EJC's can foster acceptance of equitable infrastructure deployment.<sup>100</sup>

7 **Q. Please describe the Company's proposed Workforce Development initiative.**

8 A. The Workforce Development initiative aims to collectively (among the EDCs) support  
9 approximately 75 participants, prioritizing populations that are underrepresented in the EV  
10 workforce. The proposed initiative has the following targets:

- 11 ○ Create a sustained increase in the supply of qualified electric vehicle workers;
- 12 ○ Increase the diversity of the workforce; and
- 13 ○ Foster participation from low-income residents and residents in EJC's to increase  
14 their awareness of EVs, EV infrastructure, and the EDCs' EV offerings, ultimately  
15 driving EV program participation in hard-to-reach communities.

16 The EDCs propose to partner with a vendor that has expertise in workforce development  
17 to identify market needs, develop curriculum, outline a structure to the initiative, and  
18 execute it. Workforce development needs currently under consideration include, but are

---

<sup>100</sup> Slowik, P. "Expanding Zero-Emission Mobility Equity and Access," ZEV Alliance and ICCT 2019 at 9.  
[http://www.zevalliance.org/wp-content/uploads/2019/12/ZEV\\_access\\_workshop\\_report-fv.pdf](http://www.zevalliance.org/wp-content/uploads/2019/12/ZEV_access_workshop_report-fv.pdf)

1 not limited to, the design, development, manufacture, repair and installation of EVs and  
2 charging infrastructure.

3 **Q. Please describe the Company's proposed Electrician Training initiative.**

4 A. In addition to promoting the development of new entrants to the electric vehicle workforce,  
5 the EDCs are also proposing to sponsor a state-wide Electrician Training initiative to  
6 upskill incumbent electricians. Achieving the Company's ambitious port targets outlined  
7 in the Phase III Program will require a strong pipeline of electricians. The initiative aims  
8 to collectively (among the EDCs) train more than 1,000 electricians. The initiative has the  
9 following goals:

- 10 • Educate existing electricians on electrical work related to electric vehicle charging  
11 infrastructure across segments (Public and Workplace, Residential, and Fleet);
- 12 • Educate existing electricians on the EDCs' EV-related offerings;
- 13 • Develop a list of qualified electricians that the co-sponsors can share with  
14 customers; and
- 15 • Ensure electricians can provide a seamless and well-informed customer  
16 experience.

17 In order to achieve these goals, the co-sponsors will facilitate training by partnering with  
18 organizations such as the Electric Vehicle Infrastructure Training Program and charging  
19 station providers.

20 **Q. Do comparable workforce development and electrician training initiatives exist?**

21 A. The Company is not currently aware of existing local, state, or federal workforce  
22 development or electrician training initiatives to support the electric vehicle workforce of  
23 the future. The co-sponsors will coordinate with key partners (i.e., IBEW, MassCEC, the

1 MA Clean Cities Coalition, MassHire, etc.) to develop the proposed initiatives, avoid  
 2 duplication, and ensure consistency. Furthermore, the co-sponsors will explore  
 3 opportunities to recruit additional sponsors that are aligned with the goals of the workforce  
 4 development initiative, such as automakers and charging station providers, in order to  
 5 expand the initiative’s reach and/or decrease each sponsor’s costs.

6 **Q. What is the proposed budget for the Electrician Training and Workforce**  
 7 **Development initiatives?**

8 A. As outlined in the table below, the total budget for the Workforce Development and  
 9 Electrician Training initiatives is \$2.3M and will be split between the EDCs. Collectively  
 10 between the EDCs, the Workforce Development initiative aims to reach approximately  
 11 75 participants, and the Electrician Training initiative aims to reach approximately 1,000  
 12 trainees. The Company proposes that the offering be examined after two years to determine  
 13 if these initiatives warrant increase support. The Workforce Development and Electrician  
 14 Training budget is also included in Exhibit NG-EVPP-2.

15 **Table 14: Overview of Workforce Development and Electrician Training Initiatives**

<b>Program</b>	<b>Total Estimated Budget (Split between the EDCs)</b>	<b>Estimated National Grid Budget</b>	<b>Outcome</b>
Workforce Development	\$2,000,000	\$1,000,000	Approximately 75 participants statewide
Electrician Training	\$300,000	\$150,000	Approximately 1,000 trainees statewide

1 **IX. Performance Incentive Mechanisms (“PIM”)**

2 **Q. What is the purpose of a PIM?**

3 A. The purpose of a PIM is to better align the utility’s regulatory and financial interests with  
4 the interests of the public. A PIM provides a regulated utility with a financial incentive to  
5 pursue an outcome aligned with a public policy objective, shared by regulators and key  
6 stakeholders, which typically falls outside of the utility’s core service obligations and may  
7 be uneconomic or impractical for the utility to pursue otherwise. A PIM may also provide  
8 a utility with an incentive to drive outperformance in areas that are related to its core  
9 business.

10 The Company is proposing PIMs to control the cost of EVSE deployment and advance  
11 the Commonwealth’s clean energy and environmental goals.

12 **Q. What PIMs are the Company proposing?**

13 A. The Company proposes two PIMs: (1) Cost Containment and (2) Clean Fleet, Clean Air.  
14 The Cost Containment PIM is comprised of two independent metrics: (1) L2 Cost  
15 Containment; and (2) DCFC Cost Containment.

16 **Q. Please provide an overview of the Company’s PIMs proposal.**

17 A. The Company proposes two PIMs consisting of a total of three metrics.

1

**Table 15: Summary of PIMs**

PIM	Description	Metric
Cost Containment	A PIM to maximize the deployment of EVSE within the proposed budget, by minimizing the ratepayer cost per port and sharing the savings with customers.	<p>L2 Cost Containment:</p> $\left\{ \left( \frac{Cost\ Target}{L2\ Port} - \frac{Actual\ Costs}{L2\ Port} \right) \times L2\ Ports\ deployed \right\} \times 30\%$ <p>DCFC Cost Containment:</p> $\left\{ \left( \frac{Cost\ Target}{DCFC\ kW} - \frac{Actual\ Costs}{DCFC\ kW} \right) \times DCFC\ kW\ deployed \right\} \times 30\%$
Clean Fleet, Clean Air	A PIM to maximize the abatement of PM2.5 emissions of the vehicles enabled by the Fleet Make-Ready offering by providing a company incentive to prioritize the projects with the largest PM2.5 emissions per vehicle.	Total Particulate Matter 2.5 Abatement

2 **Q. What are the Department’s criteria for evaluating PIMs?**

3 A. The Department set forth its standard for evaluating a proposed incentive mechanism in  
 4 D.P.U. 18-150. The Department uses a two-prong test to evaluate whether an incentive  
 5 mechanism is appropriate: (1) whether the PIM satisfies certain threshold principles; and  
 6 (2) whether the PIM meets the design guidelines. D.P.U. 18-150, at 120. For the first  
 7 prong, the PIM must first be found to meet the threshold principles that: (1) it advances  
 8 specific public policy goals; and (2) the affected activity is clearly outside a distribution  
 9 company’s public service obligations. If the PIM meets the threshold principles, the  
 10 Department will evaluate whether the proposed incentive mechanism meets the second

1 prong design guidelines, where the incentive mechanism must: (1) be designed to  
2 encourage program performance that best achieves the Commonwealth's energy goals; (2)  
3 be designed to enable a comparison of (i) clearly defined goals and activities that can be  
4 monitored, quantified, and verified after the fact to (ii) the cost of achieving the target to the  
5 potential quantifiable benefits; (3) be available only for activities where the distribution  
6 company plays a distinct and clear role in bringing about the desired outcome; (4) be  
7 consistent across all electric and gas distribution companies, where possible, with  
8 deviations across companies clearly justified; (5) be created to avoid perverse incentives;  
9 and (6) ensure the distribution company is not rewarded for the same action through  
10 another mechanism. D.P.U. 18-150, at 121.

11 **Q. Please describe the proposed Cost Containment PIM.**

12 A. The Cost Containment PIM will establish cost targets as described below for the Public  
13 and Workplace, MUD, and Fleet offerings within the Phase III Program to identify the  
14 expected cost to achieve a given outcome. In the case of L2, a cost per port, and in the case  
15 of DCFC, a cost per kW deployed are proposed. Based upon the Company's actual port  
16 and kW deployments, the PIM will calculate any savings against the cost targets and allow  
17 the Company to retain a 30% share of those savings as an incentive while the other 70% of  
18 the savings will be benefits for customers. Finally, the Company is proposing limits  
19 regarding minimum and maximum earnings potential. The Company proposes that it must  
20 reach at least 75% of the total L2 port installed target for the Public and Workplace, MUD,  
21 and Fleet offerings, or roughly 8,500 L2 ports, and for DCFC approximately 35,000 kW

1 installed (approximately 236 150 kW stations). In addition, the Company proposes to cap  
2 the total cost containment incentive at \$8 million over the term, or roughly 2.9% of the  
3 proposed Phase III Program budget.

4 **Q. What are the benefits of the Cost Containment PIM?**

5 A. The Cost Containment PIM will result in a more cost-efficient program with lower costs  
6 and bill impacts for a given level of charging deployments. Given the still early stage of  
7 the EV market, there are likely areas of cost reduction potential that the Company would  
8 be motivated to discover and pursue.

9 **Q. Why is a Cost Containment PIM appropriate?**

10 A. In DPU 17-13, the Department urged the Company to consider performance incentive  
11 designs that encourage cost containment.<sup>101, 102</sup> Related, an incentive following a similar  
12 cost containment design was recently approved for the Company's affiliate.<sup>103</sup>

13 **Q. Please describe the method for measuring the two Cost Containment metrics.**

14 A. The Company is currently required to perform annual cost recovery filings for the Phase I  
15 and Phase II Programs. In future cost recovery filings, the Company will use the program  
16 costs and outcomes for L2 ports and DCFC kW enabled to determine program savings.

---

<sup>101</sup> D.P.U. 17-13 at 45.

<sup>102</sup> D.P.U. 18-150 at 126.

<sup>103</sup> NY Public Service Commission Case 18-E-0138, Order July 16, 2020, at 84: The Commission finds that an EAM tied to incentivizing EV charging infrastructure at least cost is the most effective method to ensure customer benefits, at this time as customers will benefit from both the anticipated increase in penetration from EVs themselves, and also benefit by decreasing expenditures below the currently forecasted budget amounts. Further, an EAM tied to decreasing program expenditures provides a counterbalance against a utility's natural business incentive to increase Rate Base by maximizing capital expenditure spending.]

1 Any project level utility-side make-ready or customer-side make-ready for L2 or DCFC  
2 projects will be applied to their respective outcomes. Any projects installing both L2 and  
3 DCFC will use appropriate methods of allocating costs, if needed. In addition, the number  
4 of ports will be reported, as will the number of ports and kW installed for any DCFC. The  
5 Company proposes the PIM as a one-time measurement done at the end of the Phase III  
6 Program.

7 **Q. Please describe the proposed cost targets and how they were established.**

8 A. The Company is proposing a method to determine the cost per ports (L2 and DCFC) and  
9 the cost per kW target that reflects the total of utility-side make-ready and customer-side  
10 make-ready. For L2 ports, the Company proposes to use the average cost of Company  
11 support per L2 port from the Phase I program for utility-side and customer-side make-ready  
12 work (i.e., any customer-paid costs will not count towards the cost per port target). For  
13 DCFC ports, the Company proposes to use the average costs from the Phase I program per  
14 kW installed for utility-side make-ready and customer-side make-ready. The Company  
15 expects final historical cost targets to be calculated after the Phase I program is complete.

16 **Q. Please describe the actions the Company may take to achieve Cost Containment PIM**  
17 **goals.**

18 A. While the Company strives to be judicious with costs, an incentive allows additional  
19 dedication of resources to drive novel or effort-intensive opportunities to create customer  
20 value. The Cost Containment PIM will incentivize the Company to manage each type of  
21 cost. To minimize utility-side make ready, the Company will leverage existing services

1 where possible, rather than always require new service, and will restrict program support  
2 to overly expensive service upgrades. For customer-side make-ready costs, the Company  
3 will be judicious in approving above average financial support levels and will strive to  
4 reduce costs per port installed. Finally, because the incentive scales with the number of  
5 installations and amount of cost savings, the Company will strive to be maximally efficient  
6 in program administration, supporting as many projects as possible within the program  
7 budget.

8 **Q. Does the proposed Cost Containment PIM meet the Department's criteria for PIM**  
9 **proposals?**

10 A. Yes. The Phase III Program advances the specific public policy goal of electrifying  
11 transportation to improve societal and environmental outcomes. In D.P.U. 18-150, the  
12 Department found that a charging station cost containment PIM generally meets the  
13 threshold principles but noted the need to use actual costs in determining cost targets.<sup>104</sup>  
14 The Company has now filed two years' worth of cost recovery information and proposes  
15 to finalize the cost targets after the Phase I program is complete.

16 The proposed Cost Containment PIM also meets all the Department's design principles for  
17 evaluating PIM proposals, as it supports the Commonwealth's clean energy goals by  
18 supporting access to clean transportation ownership and operation; can be clearly  
19 monitored, quantified, and verified; demonstrates the Company's clear and distinct role to

---

<sup>104</sup> D.P.U. 18-150, at 85-87, 125-127.

1 facilitate, interconnect, and plan for EV charging; and does not lead to double collection of  
2 incentives (i.e., the Company is not otherwise rewarded or incentivized to reduce such  
3 costs). The Company's make-ready offerings provide consistent financial support across  
4 market segments (i.e., public, workplace, MUD, fleet, EJC's) and is designed to avoid  
5 perverse incentives.

6 **Q. Did the Company perform a net benefit analysis for the Cost Containment PIM?**

7 A. No, the two metrics are designed to allow the Company to earn an incentive for maximizing  
8 budget efficiency and EVSE deployment. The incentives are based on actual savings  
9 delivered to customers rather than an estimate of net benefits.

10 **Q. Please describe the proposed Clean Fleet, Clean Air PIM.**

11 A. The Clean Fleet, Clean Air PIM will establish program term targets for the projected  
12 lifetime air emissions of the vehicles supported by the Fleet Segment. The Fleet Segment  
13 is projected to directly support 2,000 EVs with make-ready infrastructure, and the Clean  
14 Fleet, Clean Air PIM is designed to maximize the reduction of Particulate Matter 2.5  
15 (PM<sub>2.5</sub>) emissions from those vehicles. Fleet vehicles have a disproportionate impact on  
16 air quality compared to passenger vehicles – fleet LDVs can have up to twice the PM<sub>2.5</sub>  
17 emissions of passenger vehicles due to the magnitude of miles traveled, and MHDVs are  
18 30-150 times worse per vehicle.

19 The Clean Fleet, Clean Air PIM establishes a baseline of supporting the mix of vehicles as  
20 presented in Exhibit NG-EVPP-9. To incentivize vehicle segments with higher PM<sub>2.5</sub>

1 emissions per vehicle, this PIM establishes 5%, 10%, and 15% thresholds above the  
2 budgeted mix of vehicles supported. Based upon the Company's actual mix of deployed  
3 vehicles, the PIM will calculate the incremental health benefit of additional PM2.5  
4 emissions reduction. Like the Cost Containment PIM, the Company is proposing to claim  
5 a 30% share of those savings as an incentive.

6 **Q. What are the benefits of the Clean Fleet, Clean Air PIM?**

7 A. The U.S. Environmental Protection Agency's ("EPA") Bureau of Transportation Statistics  
8 provides PM2.5 emissions per mile of travel,<sup>105</sup> as well as the estimated society health  
9 benefits of PM2.5 emissions reduction.<sup>106</sup> The EPA estimates a society value of \$400,000  
10 for every metric ton of PM2.5 pollution. That value is applied to the estimated total miles  
11 driven for the mix of vehicles supported by the Fleet Segment.

12 **Q. Please describe the proposed targets for the Clean Fleet, Clean Air PIM.**

13 A. The targets for this PIM are shown in the following table:

---

<sup>105</sup> U.S. Environmental Protection Agency, Office of Transportation and Air Quality, Apr. 6, 2018, Table 4-43, available at: <https://www.bts.gov/content/estimated-national-average-vehicle-emissions-rates-vehicle-vehicle-type-using-gasoline-and>

<sup>106</sup> EPA, 'Estimating the Benefit per Ton of Reducing PM2.5 Precursors from 17 Sectors', February 2018, at 14. Available at: [https://www.epa.gov/sites/production/files/2018-02/documents/sourceapportionmentbpttsd\\_2018.pdf](https://www.epa.gov/sites/production/files/2018-02/documents/sourceapportionmentbpttsd_2018.pdf)

1

**Table 16: PM 2.5 Abatement Targets**

<b>Target</b>	<b>Value (tons of PM<sub>2.5</sub>)</b>
Target	26.1
Min (5% above target)	27.4
Mid (10% above target)	28.7
Max (15% above target)	30.0

2

The targets for this PIM are set for a term of four years, 2022 through 2025.

3

**Q. Please describe how the proposed targets for the Clean Fleet, Clean Air PIM were established, and how the Company will work to achieve them.**

4

5

**A.** The targets for the estimated PM<sub>2.5</sub> emissions reduction are presented in the table below.

6

The targets are established using the estimated vehicles enabled by the Fleet Make-Ready

7

offering, described in Section C and detailed in Exhibit NG-EVPP-9. The lifetime PM<sub>2.5</sub>

8

emissions are then calculated using the estimated annual VMT and PM<sub>2.5</sub> emissions per

9

mile. This Clean Fleet, Clean Air PIM will provide an incentive for the Company to

10

maximize the PM<sub>2.5</sub> reduction of the make-ready projects by prioritizing those projects that

11

have the greatest PM<sub>2.5</sub> abatement on a per vehicle basis.

12

**Table 17: Estimated PM<sub>2.5</sub> Emission Baseline**

	<b>EVs Enabled</b>	<b>Annual VMT / vehicle</b>	<b>Annual PM<sub>2.5</sub> (g / mi)</b>	<b>Annual PM<sub>2.5</sub> (g / mi / vehicle)</b>	<b>Lifetime PM<sub>2.5</sub> (Tons)</b>	<b>Total Value at \$400k / Ton</b>
<b>LDV</b>	1,150	23,000	0.008	188	2.2	\$865,634
<b>MDV</b>	720	20,000	0.129	2,577	18.6	\$7,422,922
<b>HDV</b>	130	19,303	0.213	4,105	5.3	\$2,134,578
<b>Total</b>	<b>2,000</b>	<b>15,092</b>	<b>0.065</b>	<b>1,303</b>	<b>26.1</b>	<b>\$10,423,134</b>

1 **Q. Please describe the proposed incentive levels for the Clean Fleet, Clean Air PIM and**  
2 **how the Company would qualify to earn on those incentives.**

3 A. The incentive levels for this PIM are shown in the following table. The baseline is based  
4 upon the mix of vehicle types presented in Table 17 above, providing an estimated 26.1  
5 tons of PM2.5 reduction over the lifetime of the vehicles. The min, mid, and max targets  
6 represent the incremental savings from the estimated total lifetime PM2.5 reductions of the  
7 actual Fleet Make-Ready offering above and beyond the baseline.

8 **Table 18: Clean Fleet, Clean Air Savings and Incentives**

Incentive Level	Incremental Savings, \$	Company Incentive, \$
Target	\$ 0	\$ 0
Min (5% above target)	\$521,157	\$156,347
Mid (10% above target)	\$1,042,313	\$312,694
Max (15% above target)	\$1,563,470	\$469,041

9 **Q. Please provide the Company’s role and its ability to influence the outcomes proposed**  
10 **in the Clean Fleet, Clean Air PIM.**

11 A. The Department, in D.P.U. 18-150, at 126, outlined how factors outside the Company’s  
12 control can have a significant impact on the adoption rates in the passenger EV market.  
13 However, fleet vehicles are procured in a significantly different manner, and this Clean  
14 Fleet, Clean Air PIM is designed to provide a framework to increase the Company’s ability  
15 to influence the deployment of fleet vehicles in its territory to maximize the air pollution  
16 reduction benefits from the Fleet Make-Ready offering. The Company’s Fleet Make-Ready

1 offering is not negatively impacted from the same limitations of publicly facing passenger  
2 vehicles and can therefore be more influential in selecting projects for the Make-Ready  
3 offering. Vehicle availability changes, fleet specific EVSE technology and design, large-  
4 scale decision making, and the Company's Fleet Assessment Services all provide the  
5 company the ability to influence the mix of fleet vehicle procurement. With this PIM in  
6 place, the Company can prioritize fleet EV projects that represent the largest PM2.5  
7 abatement, which can sometimes require additional customer, stakeholder, and industry  
8 partner conversations to implement. As outlined above, air pollution has a disproportionate  
9 impact on the most disadvantaged communities, and this PIM provides a mechanism for  
10 the Company to prioritize those projects with the most benefit for those communities.

11 **Q. Please explain how the proposed Clean Fleet, Clean Air PIM meets the Department's**  
12 **criteria for PIM proposals.**

13 A. The Clean Fleet, Clean Air PIM aligns with the Department's criteria in D.P.U. 18-150, at  
14 121, and as outlined earlier in the testimony. This PIM complements the Cost Containment  
15 PIM, as it provides an incentive for the Company to maximize the societal and  
16 environmental outcomes of the Fleet Segment offerings and maximizes the total public  
17 health benefit of PM2.5 abatement for the make-ready projects deployed within the Fleet  
18 Segment Make-Ready offering.

19 The proposed Clean Fleet, Clean Air PIM aligns with the Department's two threshold  
20 criteria: (1) The PIM maximizes the specific public policy goal of electrifying  
21 transportation to improve societal and environmental outcomes by maximizing PM2.5

1 abatement, while (2) also incentivizing the Company to accelerate activities and market  
2 behaviors outside the Company's service obligations.

3 The Clean Fleet, Clean Air PIM also meets the Department's six design guidelines: (1) The  
4 PIM encourages program performance to achieve the Commonwealth's goals of zero  
5 emission transportation, with a specific focus on the MHDV segment. (2) The costs and  
6 outcomes of the PIM can be clearly defined and monitored during the term of the program,  
7 using project deployment data to determine the mix of vehicles that have been electrified.  
8 (3) Because the Company approves the projects within the Fleet Make-Ready offering, the  
9 Company also plays a role in achieving the desired PM<sub>2.5</sub> abatement outcomes by  
10 prioritizing fleet make-ready projects that maximize that outcome per vehicle. (4) This PIM  
11 is specific to the Company, given the Company's focus on the MHDV segment per the  
12 recent ZEV MOU MHDV targets. (5) This PIM also prevents a perverse incentive of  
13 deploying infrastructure projects that are focused primarily on LDV fleets, with less of an  
14 emphasis on the larger public health benefits from electrifying MHDV fleets with  
15 substantially higher PM<sub>2.5</sub> emissions per vehicle. (6) Finally, the Clean Fleet, Clean Air  
16 PIM does not reward the Company for actions taken through other mechanisms within the  
17 Fleet Make-Ready offering – specifically, the Company is incentivized to reduce total costs  
18 to achieve program goals as part of the Cost Containment PIM and incentivized to  
19 maximize the societal and environmental outcomes for every port deployed through this  
20 Clean Fleet, Clean Air PIM.

1 **Q. How does the Company propose to report on PIM performance results and what**  
2 **process is proposed for Department review and confirmation of these PIM targets**  
3 **being achieved?**

4 A. The Company proposes to report on PIM performance results in its annual cost recovery  
5 filings. During the implementation of the program, the Company would include an  
6 assessment in each Phase III Program cost recovery of the calculated savings against the  
7 cost targets and progress towards clean air targets.

8 **X. Resources Needed for Program Implementation**

9 **Q. What resources did the Company include to implement the Phase III Program?**

10 A. In order to successfully implement the Phase III Program, the Company is proposing to  
11 include the following necessary resources: Company Staffing, Information Technology,  
12 Marketing and Outreach, Program Management, and Evaluation.

13 **Q. What are the Company's proposed staffing needs?**

14 A. The Phase III Program expands the Company's existing EV offerings, requiring additional  
15 staffing resources. The Company is proposing 17.0 incremental FTEs, 10 of which are for  
16 Program Management roles and 7 of which are dedicated support roles within the  
17 Company. The 10 Program Management roles include incremental project managers and  
18 analysts for each segment. Additionally, the 7 dedicated support roles within the company  
19 include roles in Customer Connections, Distribution Design, and Distribution Planning, all  
20 of which will be necessary for planning, design, and construction of the projects at the scale  
21 proposed in this filing. Exhibit NG-EVPP-4 details the timing of the hires as well as the

1 cost. The cost of all incremental FTEs for the duration of the Phase III Program is  
2 approximately \$9M in non-capitalized labor cost.

3 **XI. Information Technology (IT)**

4 **Q. What IT resources has the Company included in the budget for the Phase III**  
5 **Program?**

6 A. The Company is filing Exhibit NG-EVPP-2 that includes the budget for IT for the  
7 following purposes:

- 8 • Develop and maintain a web portal to accept and manage customer applications to  
9 the Public and Workplace, MUD, and Fleet segment offerings. This will be an  
10 expanded version of the online customer portal the Company recently developed  
11 for the new charging station program run by the Company's affiliate in New York,  
12 the Niagara Mohawk Power Company.<sup>107</sup> The customer portal integrates into  
13 Company backend systems and serves as a more scalable and reliable approach to  
14 managing charging station projects. The Company proposes to make additional  
15 investments to ensure the portal meets Company IT standards for data and access  
16 management and the specifics of the Phase III Program. The Company estimates  
17 \$1.1 million of initial investment and another \$600,000 to maintain and update the  
18 portal over the term of the program.
- 19 • The Company is requesting \$60,000 for IT staff time required to help evaluate RFPs  
20 and support administration of the residential 1-4-unit offerings, as those offerings  
21 expect to use customer data to help administer rebates.

22 **Q. Why are the investments in IT resources necessary for the Phase III Program?**

23 A. The Phase III Program has ambitious targets for the number of EVSE ports installed,  
24 reflecting roughly eight to ten times the pace of activity from the Phase I program. In  
25 addition, the number of Company staff required to administer the program will increase.

---

<sup>107</sup> In Case 18-E-0138, Order July 16, 2020, at 95, the New York Commission ruled “The Joint Utilities are directed to develop an online EV Infrastructure service application portal, which may utilize existing software capability, or may be a new tool.” and included specific requirements for the operation and consistency of the portal across New York utilities.

1 Investment in the charging station web portal will allow the Company to efficiently scale  
2 its administration of the program, improve customer experience, improve data  
3 management, and enable workflows that better support the larger project management team  
4 required for such an effort. In addition, while the Company has made significant  
5 improvements to its Excel-based project tracking system,<sup>108</sup> and may continue to leverage  
6 Excel-based tracking for some elements of the Phase III Program, there is a need for a more  
7 robust, secure system to improve administration efficiency and effectiveness and the  
8 customer experience.

9 **XII. Marketing and Outreach**

10 **Q. Please describe the Company's proposed approach to Marketing and Outreach.**

11 A. The Company is proposing a Marketing and Outreach Plan to drive awareness of and  
12 participation in the proposed EV offerings, including new customer offerings among  
13 residential, commercial, and fleet customers through targeted outreach and  
14 communications. Consumer education pertaining to electric vehicle charging continues to  
15 be a barrier, making a dedicated Marketing and Outreach Plan a vital component of the  
16 proposal and the success of each program to meet participation targets. The Company's  
17 communication channels have a reach throughout its service territory, and the Company  
18 communicates with customers regularly through a variety of channels including bills, home  
19 energy reports, email, social media, billboards, digital, print and radio media serving as a

---

<sup>108</sup> Phase I PY2 Evaluation Report, Finding 5.

1 trusted advisor for their energy needs. The Company proposes that it leverage these  
2 capabilities to execute a Marketing and Outreach Plan that will: empower residential and  
3 commercial customers to make informed decisions about the benefits of installing EV  
4 charging stations for home, business or public charging; highlight opportunities to  
5 accelerate fleet electrification; and increase access to charging among LI/EJC customers.

6 In addition to traditional marketing and outreach techniques, the Company intends to  
7 leverage existing and future community and stakeholder relationships to target hard to  
8 reach customers, underserved and overburdened populations, as well as other customer  
9 segments. Working with municipalities, state agencies, CAP agencies/local non-profit  
10 organizations, the Chambers of Commerce, the EVSE installer network, car dealerships,  
11 etc., the Company will be able to expand its reach and ensure customers are aware of the  
12 resources available to them. The Company also plans to utilize existing points of contact  
13 with customers, such as those through the Energy Efficiency programs, to co-market  
14 programs, maximize reach and customer experience, and lower costs.

15 **Q. Why is a Marketing and Outreach Plan necessary?**

16 A. The Marketing and Outreach Plan will enable the Company to meet the ambitious port and  
17 fleet vehicle targets of the Phase III Program. The Phase I Program Evaluation had the  
18 below conclusions which have helped inform the Marketing and Outreach Plan. While  
19 these conclusions relate to DCFC public and workplace installations specifically, their  
20 essence can be applied to other segments and types of charging installations:

- 1 • “To shorten the DCFC sales cycle, develop sales and marketing strategies for  
2 different segments of businesses targeted for DCFC installations.”  
3
- 4 • “Utilities can play a valuable role in educating prospective site hosts about  
5 DCFC installation and help build the business case to facilitate decision-  
6 making...Programs can also increase their outreach through mass marketing,  
7 case studies, education, and internal champions at prospective site hosts.”  
8
- 9 • “All [prospective site hosts] who we spoke with agreed that [in order to remove  
10 barriers to DCFC installation] the market needs education on EVs, EV charging,  
11 and the Charging Program. Getting the word out about the program can be  
12 accomplished through mass marketing, vendors, word of mouth from early  
13 participants, and program materials and website.”<sup>109</sup>

14 Furthermore, a survey conducted by the Company in 2018 found that residential customers  
15 would be open to and trust EV-related information from National Grid and messaging that  
16 addresses the barriers to EV adoption.<sup>110</sup> These initial findings indicate the importance of  
17 Marketing and Outreach in driving the success of the Phase III Program.

18 **Q. How will the Company develop the Marketing and Outreach Plan?**

19 A. The Company will work with an advertising agency, informed by findings from currently  
20 offered programs, communication to internal EV/Energy Efficiency teams, and external  
21 partnerships to develop a Marketing and Outreach Plan that will:

- 22 • identify and prioritize residential customers who are likely to install  
23 charging infrastructure in their homes;  
24
- 25 • perform dedicated outreach to targeted environmental organizations, non-  
26 profits, state agencies, and consumer advocacy groups to ensure the  
27 Company is reaching LI/EJC customers and appropriate stakeholders across  
28 the jurisdiction;

---

<sup>109</sup> Phase I RY1 Evaluation Report at 3, 23 and 33.

<sup>110</sup> 2018 National Grid Customer Council EV Research. Slides 4; 12-16

- 1 • identify and prioritize consumer and site host benefits for EV charging  
2 accessibility and increase site hosts' familiarity with EV charging as an  
3 amenity for employees, customers, tenants, or visitors;  
4
- 5 • identify corporate parties and commercial customers that may benefit from  
6 fleet electrification and on-premises charging;
- 7 • develop messages that highlight the Company's charging infrastructure and  
8 fleet offerings and deliver them through multiple channels, listed below, and  
9 direct communication to internal teams and external partners:
  - 10 ○ Company channels (website, social media, bill inserts, call centers,  
11 sales team)
  - 12 ○ Partner channels (EVSE vendors, local auto dealers and automakers,  
13 and trade groups)
  - 14 ○ Press coverage
  - 15 ○ Purchased media
  - 16 ○ EV advocacy groups
  - 17 ○ Site host communication and engagement.

18 The Company will leverage existing marketing and outreach efforts (such as within EE,  
19 municipal programs, etc.) to increase uptake, lower costs, and provide a streamlined  
20 customer experience. The Company proposes the above-mentioned foundational tactics  
21 will be refined with the advertising agency using data derived from research with input  
22 from the partners prior to any campaign launch.

23 **Q. What are the estimated costs of the Marketing and Outreach Plan?**

24 A. The Company estimates the cost of the Marketing and Outreach Plan to be approximately  
25 \$5,571,000 (or 2.0% of the total proposed Phase III Program budget). The Company  
26 identified similarly themed awareness and participation campaigns to establish costs for  
27 the Marketing and Outreach Plan. The Company included line items for Marketing budget  
28 within various Exhibits: NG-EVPP-5, NG-EVPP-7, NG-EVPP-8, and NG-EVPP-9.

1 **XIII. Program Management**

2 **Q. Is flexibility important in managing the Phase III Program?**

3 A. Yes, to meet the needs of our customers and to be positioned to respond to the evolving  
4 transportation market, the Company is requesting flexibility to adjust our spending and the  
5 details of our offerings over the four-year term of the Phase III Program. To meet the  
6 ambitious goals of the Commonwealth through a market and customer-driven program, the  
7 Company is requesting the ability to move funds within and between program segments,  
8 while managing the overall Phase III Program within the proposed budget. This will enable  
9 the Company to optimize its strategy in real time. Specifically, we are proposing the  
10 flexibility to move funding, without prior approval, between offerings within the program  
11 segments and move up to 20 percent of the Phase III Program funds from one program  
12 segment to another. To ensure the needs of customers are being met given the quickly  
13 evolving market and to enable the Company to effectively support the Commonwealth's  
14 transportation electrification goals in an agile manner, the Company also proposes to have  
15 the flexibility to adjust components within the offerings, including incentives and rebate  
16 levels, customer eligibility requirements, and the distribution of port types. To address  
17 more substantive changes, the Company is interested in having the flexibility to initiate a  
18 mid-term review at the end of the second year of the Program. During this review,  
19 substantial modifications could be proposed with supportive justification and evidence  
20 including, for example, on-bill repayment. In the Phase I PY2 evaluation report, customers

1 indicated interest in an on-bill repayment program. The Company plans to evaluate this  
2 option to gather more information for this potential offering.

3 **XIV. Program Evaluation**

4 **Q. How will the Company evaluate the Phase III Program?**

5 A. The Company proposes to implement a comprehensive evaluation of the Phase III  
6 Program, assessing its impacts and, where possible, drawing conclusions on their effects  
7 on EV adoption. The Company will hire an independent, third-party evaluation expert to  
8 complete this work. Upon selection of the vendor, a detailed evaluation workplan will be  
9 completed to clarify the researchable questions and the evaluation methods to be utilized.

10 **Q. What will be the objective of the evaluation?**

11 A. The overall goal of the evaluation will be to characterize the Phase III Program  
12 implementation and to assess the effectiveness of its offerings. The evaluation will be  
13 conducted over a four-year program period. The evaluation will be focused on, but not  
14 limited to:

- 15 • tracking, documenting, and assessing program performance, and participation;
- 16 • understanding the experiences of participating customers in each of the program  
17 components;
- 18 • assessing barriers to non-participants, and identify opportunities to engage them;
- 19 • characterizing the experiences of low-income customers and other disadvantaged  
20 groups within each program (see additional details below);
- 21 • evaluating accessibility of charging stations for customers across the Company's  
22 territory;
- 23 • studying how program incentives, rebates and funding sources affect the adoption  
24 of EV charging stations and fleet vehicle conversion;
- 25 • identifying program barriers and barriers to electric fleet vehicle adoption; and,

- 1           • determining how program elements affect customers’ charging behaviors at home,  
2           in public, and at workplaces.

3 **Q. How will the Program impact on LI/EJC customers be evaluated?**

4 A. The research will evaluate equity considerations with respect to the Phase III Programs by  
5 characterizing the efforts to reach and serve low-income and other disadvantaged  
6 customers. The study will assess program performance and participation and identify  
7 barriers to deploying charging stations for electric vehicles and electric fleet vehicles in  
8 EJCs, as well as the experiences of LI/EJC customers served by the Residential Program.  
9 The evaluators will conduct special outreach efforts for EJCs and low-income customers  
10 as needed to ensure diverse voices are heard; these efforts may include mixed-mode  
11 surveys, in-depth interviews with CAP agencies and municipal partners, and interviews or  
12 surveys with income-eligible owners and property managers.

13 **Q. What type of tasks will be performed in the evaluation of the Phase III Program?**

14 A. Evaluation activities may include : (1) periodic surveys of a broad or targeted sample of  
15 National Grid customers, both residential and non-residential; (2) pre- and post-surveys of  
16 residential and commercial customers who frequent residential charging stations and site  
17 host facilities; (3) surveys or interviews of participating and non-participating site hosts;  
18 (4) the collection and analysis of program and charging data; and (5) in-depth interviews  
19 with program and support staff, external stakeholders, market actors, and industry experts  
20 as needed.

1 **Q. What type of reporting will occur?**

2 A. Evaluation results will be shared with the program team as they are completed in order to  
3 inform ongoing program improvement. The evaluation will cover the four-year term of the  
4 programs. After each year, an annual report will be produced summarizing evaluation  
5 results. After the conclusion of Year 4, a final evaluation report will be completed in the  
6 months following the programs' completion. The Company's target for estimating results  
7 is at the 90% confidence level, within +/- 10% precision. The Company will develop  
8 sampling protocols based on this standard. However, actual evaluation results may deviate  
9 from this standard.

10 **Q. How will the evaluation results be leveraged by the Company?**

11 A. Evaluation results may recommend changes or improvements to program design. The  
12 third-party evaluation expert and the Company's evaluation staff will discuss these  
13 recommendations with Program staff. The evaluation staff typically coordinate closely  
14 with program implementation to ensure they understand areas of uncertainty and  
15 opportunities to refine program design and how markets are evolving. Evaluation staff seek  
16 to ensure consistent, on-going communication of evaluation research to enable the program  
17 to leverage insights from evaluation in a timely manner.

18 **Q. Why is evaluation important for stakeholders?**

19 A. Evaluation provides data, analysis, and insights regarding the performance of the program  
20 that enables stakeholders to gain a deeper understanding of program strengths, limitations,  
21 and opportunities for improvement. This analysis ultimately helps to ensure that the

1 program is valuable for ratepayers and other stakeholders. This type of research is focused  
2 on the future and how the program can improve to serve customers better, adjust to  
3 changing conditions, and achieve program targets.

4 **Q. What is the proposed budget for evaluation?**

5 A. The Company has budgeted approximately \$2,387,000 of program costs to fund evaluation  
6 efforts across five years. This is in-line with other recently completed EV evaluations  
7 across the Company's service territories. Actual evaluation expenses may be higher or  
8 lower. The proposed budget includes funds for the following activities: planning and  
9 workplan development, project management, impact evaluations, surveys and interviews,  
10 and reporting. The Company has also set aside some funds for ad hoc research to support  
11 any new research area needs and priorities which emerge throughout the duration of the  
12 program.

13 **Q. Will the Company remain flexible during the evaluation?**

14 A. Yes, as needed over the course of the four-year program, the Company will coordinate with  
15 the independent evaluator to develop additional research tasks to characterize the effects  
16 of the program and identify areas of continued process improvement.

1 **XV. Program Costs**

2 **Q. What is the Company’s total estimated cost of the proposed Phase III EV Program?**

3 A. The Company is estimating the costs of the proposed Program at approximately \$277.76  
4 million, as shown in Exhibit NG-EVPP-2. Please see below table a summary of the costs  
5 by component.

6 **Table 19: Estimated Budget of the Phase III Program**

Program Component	Total Budget (\$M)
<b>Public and Workplace Total</b>	<b>\$96.77</b>
Make-Ready	\$72.85
EVSE Rebates	\$18.62
Pole-Mounted EVSE	\$1.58
DCFC Commitment	\$.50
Networking Rebates	\$1.38
Program Management	\$1.84
<b>Residential Total</b>	<b>\$64.08</b>
Make-Ready	\$41.86
EVSE Rebates	\$10.41
LI/EJC Offering	\$3.97
Site Plans	\$1.20
Program Management	\$6.64
<b>Fleet Total</b>	<b>\$98.23</b>
Make-Ready	\$17.81
EVSE Rebates	\$8.47
Fleet Assessment Services	\$3.25
EJC School Bus Rebate	\$52.50
Utility-Side System Expansion	\$15.00
Program Management	\$1.20
<b>Other Supporting Elements Total</b>	<b>\$18.68</b>
Expansion of Off-Peak Rebate Offering	\$3.84
Workforce Development and Electrician Training	\$1.51
Company Staffing	\$9.17
IT and Back-Office System Costs	\$1.78
Program Evaluation	\$2.39
<b>Total</b>	<b>\$277.76</b>

1 **XVI. Conclusion**

2 **Q. Does this conclude your testimony?**

3 **A. Yes, it does.**
